8(b) of the Administrative Procedure Act, 5 U.S.C. § 551 et seq.; Commission Rules 66(i), 90(a) and 208(a), 29 C.F.R. §§ 2200.66(i), 2200.90(a) and 2200.208(a). See generally P & Z Co., 77 OSAHRC 211/F5, 6 BNA OSHC 1189, 1192, 1977-78 CCH OSHD ¶ 22,413, p. 27,025 (No. 76-413, 1977).

2/ On remand, the judge should resolve two other matters. Exhibits R-1 and R-2 were introduced by Syntron, but are not in the official file. The originals or duplicates of the exhibits should be obtained. In addition, a videotape that was played at the hearing to depict the operation of the cited machine was not identified as an exhibit, introduced into evidence, or included in the official file. The status of this videotape must be clarified. Judge LaVecchia should determine whether it is to be considered evidence in this case. If it is evidence, the judge should include the videotape in the record, or, if it is not available, include a summary of the matters it depicts in the record.

Appearances:

For the Government: Ronnie A. Howell, Atty.

For the Respondent: Henry McCreight, Atty.

DECISION

The respondent was cited for allegedly violating the machine guarding provisions of 29 CFR 1910.212(a)(1). A metal cut-off (band saw) saw was said to be operated by the respondent without a guarding device. An alleged photograph of the saw (Ex. C-1) was shown to be a saw other than the one operated by the respondent, and was apparently photographed in a different machine shop. This constitutes a fatal flaw in the government's case.

In the alternative, evidence submitted by the respondent with respect to its saw operation indicated that the operator normally has his body or extremities at least one foot away from the point of operation.

Citation No. 2 was not addressed.

In the circumstances the citations must be vacated.

ORDER

Citations Nos. 1 and 2 are vacated.

| v. | : | OSHRC DOCKET NO. 78-5805 |
| CONSOLIDATED RAIL CORPORATION, | : | |
| Respondent | : | |

JUDGE'S DECISION
JUN 23 '82
RECEIVED
FINAL ORDER ON
JUN 23 '82

ORDER

Respondent, Consolidated Rail Corporation (Conrail), was cited on November 13, 1978, for failure to comply with the safety standard, 29 C.F.R. §1910.23(c)(1),[1/] concerning an inspection pit or platform at Conrail's car repair facility in Allston, Massachusetts. On December 28, 1978, Conrail moved to dismiss the citation and the complaint on the ground that the Federal Railroad Administration (FRA), by its March 1978 policy statement, had exercised its statutory authority to regulate inspection pits, thereby exempting Conrail from OSHA's safety standard in accordance with section 4(b)(1), 29 U.S.C. §653(b)(1), of the Occupational Safety and

1/ 29 C.F.R. §1910.23(c)(1), reads in relevant part:

> (c) Protection of open-sided floors, platforms, and runways. (1) Every open-sided floor or platform 4 feet or more above adjacent floor or ground level shall be guarded by a standard railing (or the equivalent as specified in paragraph (e)(3) of this section) on all open sides except where there is entrance to a ramp, stairway, or fixed ladder....

Health Act of 1970 (the Act).[2/] Addressing the relationship between the respective jurisdictions of FRA and OSHA, the policy statement states in pertinent part:

> OSHA regulations concerning working surfaces deal with such matters as ladders, stairways, platforms, scaffolds and floor openings. Generally, these regulations are applicable in railroad offices, shops, and other fixed workplaces. There are three principal exceptions to the rule. First, they would not apply with respect to the design of locomotives and other rolling equipment used on a railroad, since working conditions related to such surfaces are regulated by FRA as major aspects of railroad operations.
>
> Second, as the agency which has exercised jurisdiction over railroad operations, FRA is responsible for the safe movement of rolling stock through railroad repair shops. OSHA requirements for general industry are in some respects inconsistent with the optimum safety of employees in this unique environment where hazards from moving equipment predominate. Therefore, OSHA regulations on guarding of open pits, ditches, etc., would not apply to inspection pits in locomotive or car repair facilities.... (Emphasis added.)

43 Fed. Reg. 10583-10590 (March 14, 1978). Accepting Conrail's contention, Commission Judge Ben Worcester entered an order on January 30, 1979, dismissing the Secretary's complaint. On January 30, 1981, a majority of the Commission, reversing Judge Worcester's order, held that the FRA's March 1978 policy statement is not a standard or regulation under section 4(b)(1) of the Act and does not preempt OSHA's authority to issue the citation against Conrail.

---

2/ Section 4(b)(1), 29 U.S.C. §653(b)(1), reads in relevant part:

> Nothing in this Act shall apply to working conditions of employees with respect to which other Federal agencies...exercise statutory authority to prescribe or enforce standards or regulations affecting occupational safety or health.

The case was remanded for a hearing on the merits. Consolidated Rail Corp., 9 BNA OSHC 1258, 1981, CCH OSHD ¶25,172 (Nos. 78-5805 et al., 1981) (Conrail I).[3/]

A hearing on the merits of the case has been postponed on several occasions at the request of the parties so that an experiment could be conducted for the purpose of determining whether guarding around inspection pits and platforms was "appropriate." In the interim, the Commission had occasion to reconsider its position announced in Conrail I. In Consolidated Rail Corp., 10 BNA OSHC 1577, 1982 CCH OSHD ¶26,044 (No. 79-1277, April 30, 1982) (Conrail II), a majority of the Commission overruled Conrail I, stating that the March 1978 FRA policy statement regarding pits and platforms associated with locomotive or car repair facilities is an exercise of the FRA's statutory authority that gives rise to an exemption under 4(b)(1) of the Act.[4/] On June 9, 1982, Conrail renewed its motion to dismiss, relying on Conrail II.

The principle set down in Conrail II is controlling and calls for dismissal of the Secretary's case. Accordingly, it is

ORDERED that Conrail's motion to dismiss the November 13, 1978, citation is granted. It is further

ORDERED that the complaint is dismissed and the citation is vacated.

Richard DeBenedetto
RICHARD DeBENEDETTO
Judge, OSHRC

Dated: June 23, 1982
Boston, Massachusetts

---

3/ On June 17, 1981, the Court of Appeals for the First Circuit dismissed Conrail's petition for appellate review on the ground that the Commission's order vacating and remanding to the Judge for fact-finding was non-reviewable.

4/ In his brief, the Secretary asks us to draw a distinction between an open-sided platform located over an inspection pit--the condition cited in the instant case--and an open inspection pit. The distinction is superficial and unsound.

|---|---|
| SECRETARY OF LABOR,<br><br>Complainant,<br>v.<br><br>POWER PLANT DIVISION, BROWN & ROOT, INC.,<br>Respondent. | OSHRC Docket No. 77-2553 |

DECISION

Before: ROWLAND, Chairman; CLEARY and COTTINE, Commissioners.

BY THE COMMISSION:

A decision of Review Commission Judge Dee C. Blythe is before the Commission for review under section 12(j), 29 U.S.C. § 661(i), of the Occupational Safety and Health Act of 1970, 29 U.S.C. §§ 651-678 ("the Act"). The principal issue in this case is whether the perimeter guarding standard for construction work at 29 C.F.R. § 1926.500(d)(1) is applicable to the working conditions in question. 1/ In particular, we must determine whether the judge correctly held that a flat surface inside a large air duct that was being constructed was an "open-sided floor" within the meaning of the standard. We conclude that the Secretary of Labor ("the Secretary") established that the cited standard is applicable here and we affirm the administrative law judge's finding of a violation.

---

1/ 29 C.F.R. § 1926.500(d)(1) provides:

> § 1926.500 Guardrails, handrails, and covers.
>
> * * *
>
> (d) Guarding of open-sided floors, platforms and runways.
> (1) Every open-sided floor or platform 6 feet or more above adjacent floor or ground level shall be guarded by a standard railing, or the equivalent, as specified in paragraph (f)(1)(i) of this section, on all open sides, except where there is entrance to a ramp, stairway, or fixed ladder. The railing shall be provided with a standard toeboard wherever, beneath the open sides, persons can pass, or there is moving machinery, or there is equipment with which falling materials could create a hazard.

I

At the time of the Secretary's inspection, Respondent, Power Plant Division, Brown & Root, Inc., was engaged in the construction of a power plant in Thompson, Texas. In the course of construction, Respondent installed a large inverted-U-shaped air duct. The duct was fabricated on the ground in sections, which were then raised into position by crane and welded together into a configuration that created an elevated flat surface inside the crook of the inverted "U", approximately 6 to 8 feet below the flattened top of the duct. This elevated flat surface, which was approximately 12 feet long and 12 feet wide, separated two parallel vertical shafts, each with an opening that was also approximately 12 feet square. The other two sides of the flat surface were connected to the bulkhead created by the interior of the air duct.

During the assembly process, it had been necessary for employees to be inside the duct on the elevated flat surface in order to guide the sections into position. Accordingly, at the time of the inspection, the remains of some scaffolding, apparently used by those employees, still were welded to the surface in question. In addition, a doubled wire rope was strung parallel to and above one edge of the surface. This edge was adjacent to the opening into one of the vertical shafts and approximately 43 feet above the base of that shaft. The record indicates that Respondent had installed the wire in anticipation of workers' entering the duct as part of final clean-up activity which, at the time of the inspection, was still to come. It is undisputed that this wire, which was 38-1/2 inches above the elevated flat surface, did not constitute a standard guardrail.

Approximately 1-1/2 months after the duct was installed, Respondent's supervisors located a "pin-hole" in the duct's metal plate as a result of a defective weld. The "pin-hole" was in the bulkhead, some 3 feet from the edge of the flat surface where the wire rope had been installed. After they had inspected the "pin-hole" from the vantage point of the elevated surface inside

the duct, the supervisors assigned two welders to patch the weld. Although the record indicates that the welding could have been done on the outside, one of the welders entered the duct alone through an existing temporary access hole cut in the bulkhead, apparently in order to see the light shining through the defective weld. But for the temporary access hole cut in the bulkhead, there was no source of light in the duct. The welder was later found dead at the bottom of the duct shaft that was adjacent to the edge of the surface where the wire rope had been strung.

On review, Respondent charges that Judge Blythe erroneously determined that the elevated flat surface at issue was a "floor" within the meaning of the cited standard. As in its post-hearing arguments, Respondent cites an unreviewed judge's decision regarding a standard pertaining to steel erection as sole authority for its contention that there is a difference in the degree of employee protection required for temporary flooring as opposed to that required for permanent flooring and that section 1926.500(d)(1) applies only to the latter. 2/ Because the surface in question was not a permanent floor, it continues, the judge erred in concluding that the cited standard was applicable. Instead, the judge should have accepted Respondent's contentions that the conditions were

---

2/ In San Jose Crane & Rigging, Inc., 73 OSAHRC 26/D1, 1 BNA OSHC 3069, 1971-73 CCH OSHD ¶ 15,791 (No. 1740, 1973), appeal dismissed, No. 73-2662 (9th Cir. 1974), the judge noted that there was no provision in the regulations relating to steel erection work specifying the time or stage of construction when a standard railing, pursuant to 29 C.F.R. § 1926.500(d)(1), is required rather than a single wire rope railing, pursuant to 29 C.F.R. § 1926.750(b)(1)(iii). He also noted that § 1926.750(b)(1)(iii), a more specific standard with respect to temporary-planked floors than the broad provision in § 1926.500(d)(1), specifically approves a single wire rope "around the periphery of all temporary-planked floors" such as that in the case before him. Therefore, he concluded that § 1926.500(d)(1) only applies to open-sided, permanent floors. In the case before us, the evidence clearly indicates that the surface in question was a permanent, and not a temporary, surface within the meaning of San Jose Crane. Moreover, there is no contention that Respondent was engaged in steel erection here. Accordingly, the cases are distinguishable.

governed by 29 C.F.R. § 1926.28(a) [3/] and that it was not in violation of that standard because the deceased employee's failure to use personal protective equipment was the result of his own unpreventable misconduct. Respondent summarizes its position as follows: it evaluated the hazard presented and selected a "mode of compliance"--safety belts and lifelines. The Secretary, in hindsight, determined that another means of compliance was better, while admitting that Respondent's chosen means would have eliminated the hazard. Accordingly, in Respondent's view, the citation should be vacated.

II

It is well settled that the burden of proving that a particular standard applies to the cited working conditions is on the Secretary. Howard Barthelmass Painting Company, Inc., 81 OSAHRC 84/E1, 9 BNA OSHC 2160, 1981 CCH OSHD ¶ 25,637 (No. 78-5450, 1981). Here, the cited standard is applicable to every open-sided floor or platform 6 feet above adjacent floor or ground level. It is not disputed that this elevated flat surface was more than 6 feet above adjacent floor or ground level; thus the sole remaining question is whether it was a "floor" or "platform" within the meaning of the standard.

In his decision, Judge Blythe noted the absence of a definition of "floor" in the Secretary's standards or in Commission decisions. Consequently, the judge resorted to the dictionary. He noted that Webster's Third New International Dictionary contains numerous definitions of "floor," including: "the bottom or lower part of any room: the part of a room upon which one stands"; "the lower inside surface of any hollow structure . . ."; and "the surface or the platform of a structure on which to walk, work or travel . . . ." The judge determined

---

3/ 29 C.F.R. §1926.28(a) provides:

§ 1926.28 Personal protective equipment.

(a) The employer is responsible for requiring the wearing of appropriate personal protective equipment in all operations where there is an exposure to hazardous conditions or where this part indicates the need for using such equipment to reduce the hazards to the employees.

that it would be unrealistic to apply a restrictive definition of "floor" to a structure such as the generating plant here. Therefore, he opted for a broad definition compatible with the remedial purpose of the Act. He concluded that, because work had been and remained to be done from and on this surface, it was a working-walking surface and, thus, a "floor" within the meaning of the cited standard, which required that standard guarding be installed on its open sides.

The record clearly establishes that the surface at issue was a working-walking surface. The evidence indicates that, weeks before the fatal accident, Respondent had used the surface during the process of assembling the air duct and had erected the line in the duct in anticipation of its employees' performing clean-up activities, such as removing the remains of the scaffold erected on the surface. Respondent's supervisors entered the duct on the morning of the accident to inspect the defective weld. They then directed the deceased to patch the hole and he, too, tread upon the surface in order to perform that assignment. We conclude, therefore, that Respondent's employees used the surface at issue in the performance of their work and were entitled to the fall protection which the cited standard is intended to provide. Commissioner Cleary agrees with the judge's conclusion that the working surface was a floor. 4/ Commissioner Cottine finds that the surface

---

4/ Commissioner Cleary does not agree with the dissenting opinion that his position in this case is inconsistent with the positions he took in Globe Industries, Inc., 82 OSAHRC __, 10 BNA OSHC 1596, 1982 CCH OSHD ¶ 26,048 (No. 77-4313, 1982), and in Arkansas Rice Growers Cooperative Association, 82 OSAHRC __. 10 BNA OSHC 1616, 1982 CCH OSHD ¶ 26,049 (No. 77-3974, 1982) (dissenting opinion). In his opinion, he has followed a consistent policy of broadly construing the Secretary's standards on falling hazards so as to effectuate their clear remedial purpose, so long as the application of the standards would not deprive employers of their right to adequate notice of the proscribed conduct. The ultimate question in each case is whether, in light of these two factors, the Secretary's enforcement action is reasonable. See Globe Industries, Inc., supra.

In the case now before the Commission, the public interest in applying the standard is strong, while any problems of adequate notice are minimal. This was equally true in Arkansas Rice Growers. Accordingly, in both cases Commissioner Cleary concluded that the citation should be affirmed. In both cases, the Secretary's enforcement action effectuated the intent of the cited standard and the purposes of the Act. Here employees were exposed to a 43-

was a platform under the definition in 29 C.F.R. § 1926.502(e) and thus finds it unnecessary to determine whether it also was a floor. 5/

---

(Footnote 4 cont'd)

foot fall from a surface that can only be described as hazardous. In Arkansas Rice Growers, employees were exposed to the hazard of falling 83 feet 9 inches through an opening in a surface that was used by employees as a walking and working surface. Moreover, in neither case did the application of the standard create a significant notice problem. Here a construction standard is being applied to an employer engaged in construction work. In this context, Commissioner Cleary sees no notice problem in characterizing a surface as a floor because it was in fact used and it was intended to be used as a floor during the construction process. In Arkansas Rice Growers, a general industry standard was applied to an employer engaged in a production operation. It was therefore appropriate to look to the function the surface was designed and intended to serve on a permanent basis. Because the record established that the surface was designed and intended to be used for two purposes on a permanent basis, and one of those uses was as a floor, Commissioner Cleary saw no notice problem in classifying the surface as a floor.

On the other hand Commissioner Cleary joined in vacating the citation in Globe Industries. It is distinguishable from Arkansas Rice Growers and the case on review. In Globe Industries, the Secretary's enforcement action contributed little to the objective of improving employee safety. The surface was a broad, flat surface only 5 feet 3 inches off the ground. A safe means of access was provided, and the single employee who went onto the surface for brief periods of time performed his functions from the center of the surface. Application of the standard would have created significant notice problems because it would have stretched the terms of the standard beyond their plain meaning and the common understanding of their meaning. The employer could not have anticipated that the surface, which was used and intended to be used only as a conveyor, would be classified as a "platform" because incidental maintenance work was performed on it on an infrequent basis to enable its continuing operation as a conveyor.

5/ In Globe Industries, Inc., 82 OSAHRC ____, 10 BNA OSHC 1596, 1599, 1982 CCH OSHD ¶ 26,048, p. 32,719 (No. 77-4313, 1982)(dissenting opinion), Commissioner Cottine noted the long-standing Commission precedent defining a "platform" to generally include surfaces on which employees actually work that are raised above the surrounding floor or ground. The definition of "platform" applicable to this citation is "a working space for persons, elevated above the surrounding floor or ground, such as a balcony or platform for the operation of machinery and equipment." 29 C.F.R. § 1926.502(e). The same definition applies under the general industry standard at 29 C.F.R. § 1910.21(a)(4), which was involved in Globe Industries, Inc., supra.

Here, the open-sided working surface was raised above the surrounding ground approximately 43 feet. In addition to its use as a working surface by the deceased employee, a welding foreman testified that it had been used by Brown & Root's employees previously and had a partial guard in the form of a wire rope strung along one side. The general welding foreman testified that he used the surface to determine what welding needed to be performed and that the welding could have been performed from this surface. Thus, the surface was actually used on several occasions as a working surface by Brown & Root's employees with its foremen's knowledge. Though this was a

Respondent also asserts in effect that the Secretary acted arbitrarily in concluding that the working conditions were governed by the cited standard rather than 29 C.F.R. § 1926.28(a). However, the standard at section 1926.500(d)(1) is more specific than that at section 1926.28(a), and therefore takes precedence. See Tri-State Roofing and Sheet Metal Co., 77 OSAHRC 208/A2, 6 BNA OSHC 1152, 1977-78 CCH OSHD ¶ 22,409 (No. 16121, 1977)(lead opin.). Therefore, the citation properly alleged noncompliance with section 1926.500(d)(1). Respondent further asserts that its mode of compliance--safety belts and lifelines--would have eliminated the hazard, but for the isolated incident of employee misconduct by the deceased, who failed to use his safety belt. We also reject this contention. The Commission has held that safety belts are not "equivalent protection" to guardrails within the meaning of section 1926.500(d)(1). Warnel Corp., 76 OSAHRC 41/C5, 4 BNA OSHC 1034, 1975-76 CCH OSHD ¶ 20,576 (No. 4537, 1976). Moreover, Respondent's argument that its employee's failure to tie off his safety belt was unpreventable employee misconduct does not establish a defense to a cita-

---

(Footnote 5 cont'd)

construction site and the employees were not on the surface on a regular and predictable basis, in Commissioner Cottine's view the surface meets the definition of a platform under the construction standard at § 1926.502(e).

Commissioner Cottine also notes that Judge Blythe incorrectly concluded that the Commission has limited the definition of "platform" to structures erected for the purpose of performing work. The judge relied on the lead opinion in Otis Elevator Co., 77 OSAHRC 80/A2, 5 BNA OSHC 1429, 1977-78 CCH OSHD ¶ 21,821 (No. 13140, 1977). However, that opinion reflected the views of only one Commissioner. The controlling Commission precedent is discussed in Globe Industries, Inc., supra.

tion where, as here, the violation alleged is the lack of a standard guardrail around an open-sided floor. See Wander Iron Works, Inc., 80 OSAHRC 40/A2, 8 BNA OSHC 1354, 1980 CCH OSHD ¶ 24,457 (No.76-3105, 1980).

Accordingly, we affirm the citation and, in light of the penalty criteria specified in section 17(j) of the Act, 29 U.S.C. § 666(i), and the parties' stipulation, we assess a penalty of $300.

SO ORDERED.

FOR THE COMMISSION

Ray H. Darling, Jr.

Ray H. Darling, Jr.
Executive Secretary

DATED: JUL 27 1982

ROWLAND, Chairman, Dissenting:

I dissent from the majority's conclusion that the standard cited in this case, 29 C.F.R. § 1926.500(d)(1), was shown to be applicable to the working conditions in question. Since I would also find that Respondent did not know nor reasonably could have known that the deceased employee would fail to use the required safety belt, I would conclude that Respondent did not violate the personal protective equipment standard at 29 C.F.R. § 1926.28(a). Accordingly, I would vacate the citation.

At the outset, I find it instructive that the majority in this case is divided on the proper characterization of the surface at issue. Although both Commission members rely on the use of the surface for the performance of work, each draws a different conclusion from that fact. Commissioner Cottine finds the surface to be a "platform" because that term is expressly defined as "a working space for persons." Commissioner Cleary expresses agreement with the judge's conclusion that the surface is a "floor" within the dictionary definition of a floor as a surface on which work is performed. 6/ The fact that members of this Commission, who must interpret the Secretary's standards, disagree on the proper terminology and definitions to be applied in determining Respondent's obligation is a strong indication that the language of the standard in question is imprecise.

Indeed, the Commission has previously recognized that a similar guardrail standard, section 1910.23(c)(1), 7/ must be interpreted in a reasonable manner

---

6/ See note 12 infra.

7/ 29 C.F.R. § 1910.23(c)(1), which applies to employers in general industry, is virtually identical to the standard at issue in this case, which imposes guarding requirements for employers engaged in construction work. See note 5 of the lead opinion.

in order to afford an employer fair notice of its obligations under the standard. In a case substantially similar to this, Globe Industries, Inc., 82 OSAHRC , 10 BNA OSHC 1596, 1982 CCH OSHD ¶ 26,048 (No. 77-4313, 1982), the Commission considered whether under section 1910.23(c)(1) guardrails were required along the open sides of the tops of two conveyor belts. In concluding that these surfaces did not come within the definition of a platform as "a working space for persons," the Commission relied on the fact that the conveyor tops were used as a work surface only during a maintenance operation, when the normal manufacturing process was not in operation. It therefore held that to consider the conveyor belts "platforms" would exceed the plain meaning of that term and conflict with the common understanding of what constitutes a "platform." In so holding, the Commission expressly adopted the reasoning of the court in General Electric Co. v. OSHRC, 583 F.2d 61, 64 (2d Cir. 1978):

> We do not read this definition [of "platform"] to apply to every flat surface . . . upon which employees may someday stand while performing some task related to their employment and the operations of their employer. An elevated flat surface does not automatically become a "working space" and a "platform" merely because employees occasionally set foot on it while working.

Under this precedent, applicability of these standards to surfaces on which employees work depends upon a number of factors, including the nature of the surface in question and the frequency and regularity with which employees go onto the surface in the performance of their assigned duties. It is not sufficient to find section 1926.500(d)(1) applicable, as the majority does in this case, solely on the basis that Respondent's employees used the surface in question in the performance of their work without regard to the regularity or predictability of such use.

The record demonstrates that the surface in question, which formed an interior portion of a large prefabricated section of ductwork, was neither designed nor intended to function as a working surface for employees. Although employees ultimately did perform some work from the interior surface once the ductwork had been elevated by crane into a vertical position, 8/ it is quite clear that such work was only for completion of the ductwork installation. Upon completion, the opening in the ductwork which permitted access to the interior surface was to have been sealed. As Commissioner Cottine correctly observes in note 5 of the majority opinion, the performance of work by Respondent's employees from within the duct was neither recurrent nor predictable. 9/ It is undisputed that during the one and one-half to two-month period which elapsed between installation of the ductwork and detection of the hole by Respondent's supervisors, no employee had entered the ductwork for any purpose. Indeed, the work operation which resulted in the employee's death and eventually in the citation at issue would not have been performed at all were it not for the incidental discovery of an improper weld.

On these facts, a reasonable employer would not conclude that the interior surface of a large metal structure which forms part of a building's ventilation system is a "working space" requiring the provision of guardrails simply because employees worked from that surface while installing the ductwork. This conclusion is consistent with the design and configuration of

---

8/ The ductwork was originally assembled on the ground in a horizontal configuration. At that time, the surface now claimed to be a working surface was vertical, so that in relation to Respondent's employees it formed a side or wall of the duct.

9/ The surface was to be used primarily for inspection and final clean-up. Although some tack welding had also been performed from the surface, the record does not indicate that this welding was conducted either frequently or regularly.

the duct surface as well as the fact that its use as a work surface is neither regular nor predictable. Although the majority characterizes the surface as flat, its open sides are curved, thus forming a gradual roll or drop-off. The cited standard requires that the employer provide "a standard railing, or the equivalent," which is defined at section 1926.502(k) as a "vertical barrier erected along exposed edges . . . ." The standards, however, give no guidance by which an employer can determine where the "edge" exists on a sloped or curved surface. The compliance officer himself testified that he had never seen similar ductwork equipped with guardrails. Accordingly, in view of the infrequency and irregularity of use, the evident unsuitability of the curved surface for the installation of guardrails, 10/ and the absence of evidence to show that guardrails are customarily used by the industry in such circumstances, Respondent cannot be said to have fair notice that the cited standard is applicable to it in this case. See Faultless Division, Bliss & Laughlin Industries, Inc. v. Secretary of Labor, 674 F.2d 1177, 1192-93 (7th Cir. 1982) (dissenting opinion), citing B&B Insulation, Inc. v. OSHRC, 583 F.2d 1364 (5th Cir. 1978); Borton, Inc., 82 OSAHRC 17/E13, 10 BNA OSHC 1462, 1982 CCH OSHD ¶ 25,983 (No. 77-2115, 1982) (dissenting opinion). Indeed, the language of the Commission decision in Globe Industries, supra, is

---

10/ The Secretary's standard which expressly provides for fall protection for employees on sloped surfaces, section 1926.451(u)(3), requires that employees use safety belts attached to a lifeline if they are not otherwise protected by a parapet or catch platform. This requirement is predicated on the Secretary's conclusion that a sloping surface itself presents a fall hazard. Hamilton Roofing Co., 78 OSAHRC 57/C1, 6 BNA OSHC 1771, 1978 CCH OSHD ¶ 22,856 (No. 14968, 1978). As discussed infra, Respondent required its employees to use tied-off safety belts in the circumstances presented here.

equally appropriate here: "In view of the totality of the facts . . . acceptance of the Secretary's position . . . would stretch that term ['platform'] beyond its plain meaning and lead to results that conflict with the common understanding of what a 'platform' is." 10 BNA OSHC at 1598-99, 1982 CCH OSHD ¶ 26,048 at 32,719. 11/

The same conclusion applies even if we consider the issue before us, as Commissioner Cleary states, to be whether the surface in question constitutes a "floor." Under the Commission precedent I have discussed, the application of the standard depends not on the incidental selection of terminology but on the reality of the nature of the surface in question and the extent to which it is used by the employer. Clearly, it is no more reasonable to construe the interior surface of Respondent's ductwork as a "floor" based on irregular or infrequent use by employees than it is to consider the surface a "platform" on the same basis. 12/ Cf. Arkansas Rice Growers Cooperative Association, 82 OSAHRC , 10 BNA OSHC 1616, 1620 n.6, 1982 CCH OSHD ¶ 26,049 at

---

11/ Because the facts indicate that the duct surface was not erected and designed for use by employees while operating machinery or equipment, I would also conclude that it cannot be considered a "platform" for the reasons stated by former Commissioner Moran in Allis-Chalmers Corp., 76 OSAHRC 50/F8, 4 BNA OSHC 1227, 1975-76 CCH OSHD ¶ 20,666 (No. 5210, 1976). See Globe Indus., supra, 10 BNA OSHC at 1599 n.7, 1982 CCH OSHD ¶ 26,048 at 32,719 n.7; General Electric Co., 81 OSAHRC 97/D6, 10 BNA OSHC 1144, 1981 CCH OSHD ¶ 25,736 (No. 76-2879, 1981).

12/ I do not mean to suggest that the terms "platform" and "floor" are synonymous. However, in the circumstances of this case it is unnecessary to consider whether these terms are intended to refer to different components of a building or structure, or whether they may be differentiated in any other way. In this regard, I note that the definitions on which the judge relied, which are quoted in the lead opinion, offer no guidance for distinguishing a "floor" from a platform as the latter term appears in the Secretary's standards. Indeed, one of three definitions of "floor" quoted by the judge itself uses the term "platform."

32,724 n.6 (No. 77-3974, 1982) (cases holding that the roof of a building is not a "floor" under section 1926.500(d)(1) necessarily imply that it is not a "platform" as well). 13/

As the judge properly observed, Respondent had a work rule requiring that employees use safety belts when working at heights. The judge, concluding that Respondent had tried by consent the issue of a violation of the general protective equipment standard at 29 C.F.R. § 1926.28(a), held that nevertheless Respondent's safety program with respect to the use of safety belts was inadequate. Because Respondent does not except to the judge's ruling regarding trial by consent, the issue of whether Respondent violated section 1926.28(a) is before us at this time. For the reason that follow, I do not agree with the judge's conclusions on this issue.

In a case such as this, where an employee commits an act contrary to a workrule established by the employer, the Secretary must establish that the employer either knew or with reasonable diligence could have known of the violation. Capital Electric Line Builders of Kansas, Inc. v. Marshall, No. 80-1711 (10th Cir. May 12, 1982); Marson Corp., 82 OSAHRC , 10 BNA OSHC 1660 (No. 78-3491, 1982) (dissenting opinion). 14/ The Secretary presented no evidence to show that Respondent had actual knowledge that the deceased employee was not wearing a belt when the work commenced. On the other hand, both

---

13/ In his dissenting opinion in Arkansas Rice Growers, supra, Commissioner Cleary concluded that the roof in question was a "floor" under the standard because it was used by employees for the performance of work on a regular, recurring, and frequent basis. In this case, however, he concludes that a floor existed because some work was performed on the duct surface without regard to the infrequency and irregularity of that work.

14/ Although the judge concluded that Respondent's foremen with the exercise of reasonable diligence should have known that the deceased employee was not wearing a safety belt at the time in question, his decision otherwise refers to the "affirmative defense" of "employee misconduct." As explained in my dissenting opinion in Marson, supra, this "affirmative defense" impermissibly avoids placing the burden on the Secretary to establish what

(Continued)

of Respondent's two supervisors who assigned the work stated that Respondent's employees including the deceased customarily wore belts when required.

The record, furthermore, demonstrates that Respondent's employees were informed that violation of Respondent's work rule was cause for termination, that supervisors regularly inspected the job for compliance with safety rules, and that employees have in fact been terminated for failure to follow safety instructions including the failure to tie off where required. The deceased employee was regarded as an experienced and competent worker, and he never had had to be reprimanded for a safety belt infraction. Finally, Respondent maintained a program of installing lifelines, to which employees could tie off, both automatically as the work progressed and on request from any supervisor. Therefore, even assuming, without deciding, that an employer is required to enforce as well as communicate safety instructions to employees, Respondent could not have foreseen that the deceased employee would violate its safety rule, and it cannot be held in violation of 29 C.F.R. § 1926.28(a). 15/

---

14/ (Continued)

is in reality an essential element of his case. Therefore, while arguably consistent with Commission precedent, the judge's characterization of the issue before him under section 1926.28(a) is in my view erroneous.

15/ In finding Respondent's safety program inadequate, the judge reasoned that Respondent's safety rule was not sufficiently specific, and he further found that in any event whether to comply with the rule was left to the discretion of individual employees. As Respondent correctly points out in its brief before us, its safety rule is at least as specific as section 1926.28(a), which is a general protective equipment standard. The judge's additional finding is premised on an evident misreading of the testimony of Respondent's foreman, who stated that whether to discipline employees for infractions of safety rules is left to the discretion of the foreman. The foreman, however, also stated that his superiors would "make it hard on me" if he consistently failed to terminate employees for violation of safety rules. In any event, even assuming the judge had correctly read the testimony, the fact that compliance with a safety rule is left to the judgement of an experienced employee is not necessarily indicative of a poor safety program. See Capital Electric, supra, slip op. at 8.

OCCUPATIONAL SAFETY AND HEALTH REVIEW COMMISSION

| | |
|---|---|
| SECRETARY OF LABOR,<br>Complainant,<br>v.<br>POWER PLANT DIVISION,<br>BROWN & ROOT, INC.,<br>Respondent. | OSHRC DOCKET NO. 77-2553 |

## DECISION AND ORDER

Appearances:

James F. Gruben, Esq., of Dallas, Texas, for the complainant.

William L. Bedman, Esq., of Houston, Texas, for the respondent.

## STATEMENT OF THE CASE

BLYTHE, Judge:

This is a proceeding brought before the Occupational Safety and Health Review Commission ("the Commission") pursuant to §10 of the Occupational Safety and Health Act of 1970, 29 U.S.C. §651, et seq. ("the Act"), contesting one citation issued by the complainant, the Secretary of Labor ("the Secretary"), to the respondent, Power Plant Division, Brown & Root, Inc., under authority vested in the Secretary by §9(a) of the Act.

As the result of an inspection conducted on July 15, 1977, of a workplace at W. A. Parrish Generating Station, Thompsons, Texas, where respondent was constructing a steam power plant, one citation was issued to respondent on August 4, 1977, alleging that it violated §5(a)(2) of the Act in that it failed to comply with a safety standard promulgated by the Secretary, codified at 29 CFR 1926.500(d)(1). Respondent gave timely notice of contest August 8, 1977, and thereafter a complaint and an answer were filed with the Commission.

A hearing was convened at Houston, Texas, on November 15, 1977. No affected employee or representative of affected employees participated in this proceeding. Both of the parties have submitted post-hearing briefs.

Respondent admitted the jurisdictional allegations of the complaint and stipulated (Tr. 5) that, if it should be found in violation, the proposed penalty of $300 is appropriate. The only issue remaining to be determined is whether respondent was in violation of 29 CFR 1926.500(d)(1). This subsumes the issue of whether a flat surface inside a large air duct was a floor or platform within the meaning of the cited standard.[1]

## OPINION

The inspection which resulted in the citation here involved was triggered by a fatal accident in which Billy Parrish, a welder employed by

---

[1] 29 CFR 1926.500(d)(1):

Every opensided floor or platform 6 feet or more above adjacent floor or ground level shall be guarded by a standard railing, or the equivalent, as specified in paragraph (f)(i) of this section, on all open sides, except where there is entrance to a ramp, stairway, or fixed ladder. . .

respondent, fell 43 feet inside a large air duct which, at that point, was in the shape of a flattened, inverted U. Parrish apparently had gone inside the duct to inspect a crack which he and another welder had been instructed to repair. The crack was located on a bulkhead about 1 1/2 feet above a 12' x 12' flat steel surface and about the same distance from the rounded-off edge of this surface.[2]

A doubled wire rope[3] was strung between the bulkheads (Tr. 64) about 38 1/2 inches above the edge of the flat surface (Tr. 19).

There was no midrail at the time of the accident but by the time of the inspection, the next day, the doubled-back portion of the top rail had been strung through newly-installed pad eyes 17 1/2 inches off the deck (Tr. 46).

The citation and complaint allege only that the open side was guarded by a "single rail". Paragraph (f)(1) of §1926.500 requires that a standard railing, as used in paragraph (d)(1), shall have a top rail approximately 42 inches above the floor or platform and an intermediate rail halfway between

---

[2] The evidence is somewhat conflicting regarding the latter distance. Gary Godwin, respondent's chief structural steel welding foreman, said it was about 3 feet (Tr. 63), while Cecil B. Minor, Jr., a foreman under him who actually found the crack, said it was 12 to 15 inches (Tr. 101). This distance is not critical, but I find Minor's estimate the more convincing since it is borne out by a photograph, Exhibit C-2, and since he seemed more familiar with the site than Godwin.

[3] Respondent refers to this wire rope as a "lifeline" and contends it was there for the purpose of permitting employees to attach their safety belts and lanyards.

the top rail and the floor or platform. Paragraph (f)(1) also contains rather detailed specifications which need not be repeated here except that the supports must be no more than 8 feet apart and where, as here, wire rope is used the top rail must be able to withstand a pressure of 200 pounds "with a minimum of deflection." Here the supports were 12 feet apart and there is some evidence (to be discussed later) that the top rail was not taut.

The duct was fabricated in sections on the ground, then the sections were hoisted into position and welded together. This welding was accomplished from the outside, but it was necessary for employees to go inside the duct to guide the sections into position (Tr. 105). This phase of the construction was completed about 1 1/2 or 2 months before the accident (Tr. 73). Thereafter there were few occasions for employees to enter that portion of the duct, though Foreman Minor said work had been done there before (Tr. 92) and that he had been there several times (Tr. 106) and had made many trips in and out of the duct (Tr. 103). Aside from the task in which Parrish was engaged when he was killed, all that remained to be done on the 12' x 12' surface was "clean-out", including removal of steel scaffolding which was welded to it (Tr. 69, 81).

Access to the 12' x 12' surface was gained through a 2' x 3' hole cut in the bulkhead (Tr. 68). This hole was temporary and was to be closed permanently after the scaffolding was removed and the duct's interior had been cleaned out (Tr. 52). There was no artificial lighting in the duct, and the only light came through the access hole (Tr. 78). Compliance Officer Donovan S. Donnelly testified that the interior was so dark it took time for

one's eyes to accommodate to it (Tr. 29), but Foreman Godwin testified he could see the "lifeline" about 3 feet to the left when he stuck his head inside (Tr. 53, 63).[4]

After Foreman Minor located the crack (actually a gap in the welding of a seam), he and Foreman Godwin looked at it together from the inside of the duct and then told Parrish and another welder, Dennis Kowalik, to weld it (Tr. 88). The procedure to be used was left up to the welders (Tr. 66). They could have welded it from the inside (Tr. 66), but it was more logical that they would do it from the outside where the original welding was done (Tr. 75). Although the crack could be seen from the outside, it was more visible from the inside since the inside was dark and the outside was light (Tr. 78). Parrish may have decided to inspect the crack from the inside to see whether it ran under some flanges (Tr. 100). Kowalik did not go into the duct with him; nobody saw Parrish fall to his death. When found at the bottom of the duct, his body had on no safety belt (Tr. 79).

Respondent's contentions are: (1) That the surface from which Parrish fell was not a "floor or platform" so as to make applicable the guardrail provisions of 29 CFR 1926.500(d)(1); (2) that the applicable standard is 29 CFR 1926.28(a),[5] under which Parrish should have been protected by a safety belt

---

[4] Respondent was not alleged to have violated the illumination standard, 29 CFR 1926.56(a).

[5] 29 CFR 1926.28(a) provides:

The employer is responsible for requiring the wearing of appropriate personal protective equipment in all operations where there is an exposure to hazardous conditions or where this part indicates the need for using such equipment to reduce the hazards to the employees.

and lanyard tied off to a lifeline; and (3) that Parrish's failure to wear a safety belt was an isolated act of employee misconduct.

The applicability of §1926.500(d)(1) depends upon whether the 12' x 12' surface from which Parrish fell was an "opensided floor or platform" within the meaning of that standard.

"Floor" is not defined by the standards, but "platform" is defined by §1926.502(e) as

> A working space for persons, elevated above the surrounding floor or ground, such as a balcony or platform for the operation of machinery.

From the foregoing summary of the facts, it might appear that the 12' x 12' surface was a "working space for persons" and therefore a "platform." Certainly work had been and remained to be done therefrom. However, the Commission has construed the definition of "platform" as being restricted to a structure that is erected for the purpose of performing work therefrom. Otis Elevator Co., 77 OSAHRC 80/A2, 5 BNA OSHC 1429, 1977-78 CCH OSHD ¶21,821. Thus it seems clear that the surface here involved was not a "platform," since it was not erected for the purpose of performing work therefrom but was an integral part of the power plant structure.

There remains the question of whether this surface was a "floor" within the meaning of §1926.500(d)(1). It definitely was not in the sense that it was to be a permanent floor in the finished structure; in fact, the temporary hatch providing access to it was to be closed permanently during construction.

No case quite in point has been cited by the parties. Respondent cites the unreviewed decision of Judge Burchmore in San Jose Crane & Rigging, Inc., 3 OSAHRC 760, 1971-73 CCH OSHD ¶15,791 (No. 1740, 1973), Secretary's appeal dismissed January 3, 1974 (No. 73-2662, 9th Cir.); Langer Roofing & Sheet Metal, Inc., v. Secretary of Labor and OSHRC, 524 F. 2d 1337 (7th Cir., 1975); and Diamond Roofing Co., Inc., v. OSHRC, 528 F. 2d 645 (5th Cir. 1976).

In San Jose, as respondent points out, Judge Burchmore held that §1926.500(d)(1) applied only to"open sided, permanent floors." However, the problem in that case was when a temporary floor installed under a steel erection standard, §1926.700(b)(1)(iii)—which requires only a single wire rope safety railing—became permanent enough to come under the more stringent requirements of §1926.500(d)(1), requiring top rail, intermediate rail and toeboards. The quoted language from this decision is taken out of context and has no relevance here.

Langer and Diamond, though followed by the Commission majority in Central City Roofing, Inc., 76 OSAHRC 61/A2, 4 BNA OSHC 1286, 1976-77 CCH OSHD ¶20,761 (No. 8173, 1976), in holding that a flat roof is not a "floor," as the latter term is used in §1926.500(d)(1), likewise are of little assistance, since their rationale was founded on the existence of other standards dealing with safeguarding employees on roofs, leading to the conclusion that flat roofs were not intended to be covered by the guardrail standards. There is no such parallel here. It is a non sequistur to say that since a flat roof is not a floor neither is a surface such as is here involved.

In the absence of a definition of "floor" in the standards or in Commission decisions, resort may be had to the dictionary. Webster's Third New International Dictionary contains numerous definitions of "floor," including:

> 1: the bottom or lower part of any room: the part of a room upon which one stands
> 2a: the lower inside surface of any hollow structure . . .
> 4: the surface or the platform of a structure on which to walk, work or travel . . .

It should be kept in mind that the structure here involved was not a conventional building but a large generating plant. To apply a restrictive definition of "floor" to such a structure would be unrealistic and defeat the remedial purpose of the Act. The broader dictionary definition is more compatible with this purpose. The surface involved was, at the time of the fatal accident and of the inspection, a working-walking surface. Work remained to be done from and on this surface. Respondent recognized the fall hazard by erecting a single wire rope at the approximate height of a standard toprail (which it now insists was a "lifeline" for attaching safety belts and lanyards). I find that at the pertinent times the surface involved was a "floor" and that its open side should have been guarded by a standard guardrail under §1926.500(d)(1).

Respondent does not contend that a standard guardrail was provided. There was no midrail, the top rail was 5 1/2 inches lower than standard, and the supports were further apart than required. The Compliance Officer, on the basis of a photograph which showed a kink in the top rail on the day of the

inspection, opined that it was not taut (Tr. 46). He had not tested it to see whether it met the requirement of §1926.500(f)(1)(iv) that it

> . . . be capable of withstanding a load of at least 200 pounds applied in any direction at any point on the top rail, with a minimum of deflection.

In view of Foreman Godwin's testimony (Tr. 74) that this rail was taut, it must be concluded that the Secretary has not met his burden of proof on this point.

If I should be held in error in holding that §1926.500(d)(1) is applicable to the facts of this case, it will be necessary to determine whether, as respondent contends, §1926.28(a) is applicable and, if so, whether it complied therewith. Since the matter was raised by respondent and fully litigated without objection, amendment of the citation and complaint to conform to the evidence, to allege a violation of 28(a), would be proper under Rule 15(b), F.R.C.P. Warnel Corporation, 76 OSAHRC 41/C5, 4 BNA OSHD 1034, 1975-76 CCH OSHD ¶20,576 (No. 4537, 1976).

In contending that §1926.28(a) is the applicable standard, respondent does not rely on the provision of §1926.500(d)(1) that the "equivalent" of a standard railing may be substituted therefor, and it is well established that safety belts are not such an equivalent. Warnel Corporation, supra. Instead, respondent maintains that safety belts were superior to guardrails in the situation presented. This ignores the well-known tendency of employees (here well illustrated) not to wear or use safety belts, as well as the injuries that an employee using a tied-off safety belt might sustain in a 6-foot fall to the end of his lanyard, as the compliance officer testified (Tr.34, 39). A standard

guardrail, which does not depend on human behavior or employee compliance for its effectiveness, offers fall protection superior to that afforded by safety belts in the open-sided floor situation here presented [6]. Incidentally, Welding Foreman Minor admitted that Parrish probably would not have fallen if the open side had been guarded by a standard railing (Tr. 101).

Assuming that §1926.28(a) is applicable, there remains the question of whether respondent complied with it. As stated, the deceased employee, Parrish, did not have on a safety belt when his body was found. Respondent claims this was an isolated act of employee misconduct in disobeying its work rule requiring the use of safety belts by employees working at heights.

The essential elements of the isolated incident defense are set forth in Weatherhead Co., 76 OSAHRC 61/E7, 4 BNA OSHC 1226, 1976-77 CCH OSHD ¶20,784 (No. 8862, 1976), where the Commission majority said at p. 24,922 of CCH:

> The existence of an "isolated incident," or perhaps more accurately an unpreventable occurrence, is an affirmative defense wherein the employer bears the burden of proving that the actions constituting non-compliance with the standard were: (a) unknown to the employer and (b) contrary to both the employer's instructions and a company work rule which the employer had uniformly enforced. [Citations omitted]

"Work rule" was further defined in J. K. Butler Builders, Inc., 77 OSAHRC 26/A2, 5 BNA OSHC 1075, 1977-78 CCH OSHD ¶21,585 (No. 12354, 1977), as

---

[6] Cf., B. C. Crocker dba Crocker Cedar Products, 76 OSAHRC 132/B6, 4 BNA OSHC 1775, 1976-77 CCH OSHD ¶21,179 (No. 4387, 1976).

. . . an employer directive that requires or proscribes certain conduct, and that is communicated to employees in such a manner that its mandatory nature is made explicit and its scope clearly understood.

Additionally, the work rule must be the equivalent of the standard the respondent is accused of violating. Kansas Power & Light Co., 77 OSAHRC 39/A2, 5 BNA OSHC 1202, 1977-78 CCH OSHD ¶21,696 (No. 11015, 1977). Rod T. Seals, respondent's safety supervisor[7], testified that each new employee was told to wear safety belts and to tie off "any time he is off the ground on a structure," or face a penalty of immediate termination (Tr. 113, 114). There is no direct evidence that this work rule was communciated to Parrish, but Welding Foreman Godwin testified that it was "customary" to wear safety belts on the job and he never saw Parrish without one (Tr. 79). Welding Foreman Minor testified that Parrish was good about wearing his safety belt but couldn't say whether Parrish had one on when he directed him and another welder to weld the crack in the duct (Tr. 88, 90). Minor said welders usually wore their safety belts under their loose-fitting shirts with the shirttails out to avoid providing a pocket that might catch sparks or molten metal (Tr. 89). Minor also testified that it was "left up to you to use your own discretion" when to tie off one's safety belt (Tr. 107).

Seals testified that 39 employees had been terminated for infractions of safety rules in a one-year period (Tr. 114) but did not say whether any of these terminations involved non-use of safety belts.

---

[7] He was one of 3 field inspectors on the job at the time of the inspection but had never inspected the duct here involved.

It is apparent from the foregoing summary of the evidence that the requirements of Weatherhead, J. K. Butler and Kansas Power & Light have not been met. The claimed work rule was to some extent discretionary in its application, and it was not the equivalent of §1926.28(a). The two welding foremen, in the exercise of reasonable diligence, should have known that Parrish did not have on his safety belt when they sent him aloft to weld the duct. Respondent has not sustained its burden of proving this affirmative defense.

## FINDINGS OF FACT

On the basis of the stipulations and the credible evidence of record, the following findings of fact are made:

1. The respondent, Power Plant Divison, Brown & Root, Inc., is an employer engaged in a business affecting commerce who has employees.

2. On July 14, 1977, respondent was engaged in the construction of a large power plant, known as W. A. Parrish Generating Station, at Thompsons, Texas. A large air duct, which at the point here involved was in the shape of an inverted U, had an interior horizontal metal surface, measuring approximately 12' x 12' with rounded edges on two sides, on the bottom of the inside top of the inverted U. A temporary hatch measuring about 2' x 3' had been cut in the side of the duct to provide access. A doubled wire rope, fastened to pad eyes 12 feet apart at a height of about 38 1/2 inches, was on the left side as one entered the duct through the temporary hatch. There was no midrail or toeboard, but no toeboard was necessary since

no employees were working below. The next level was 43 feet below the 12' x 12' surface where the duct made a 90 degree bend. The duct's interior was not artificially lighted, and the only illumination was dim light coming from the open hatch.

3. The duct had been fabricated in sections on the ground, and the sections had been hoisted into position and welded together. During this process it was necessary for employees to work on and from the 12' x 12' surface to align the sections for welding. At the time of the inspection, the only work remaining to be done on the 12' x 12' surface was clean-up work, including removal of steel scaffolding welded thereto.

4. On July 14, 1977, Welding Foreman Minor, inspecting the interior of the duct for leaks, found a gap in a welded seam and showed it to his superior, Welding Foreman Godwin. Minor instructed two welders, Parrish and Kowalik, to repair same. The gap in the weld was in the side of the duct about 15 inches above the 12' x 12' surface and about the same distance from the rounded edge. About 38 1/2 inches above this edge was a doubled wire rope strung between pad eyes welded to the bulkheads, which were 12 feet apart.

5. The welding procedures were left to the discretion of Parrish and Kowalik. It was logical that the welding be done from the outside, since the original seam was welded in that manner. However, it was also logical, and not contrary to instructions, for Parrish to enter the duct to inspect the gap from the inside preparatory to the welding. Parrish entered the duct alone through the temporary hatch opening onto the 12' x 12' surface. He was

not wearing a safety belt. He fell from the rounded edge above which the wire rope was strung and was fatally injured.

6. The 12' x 12' surface in the duct, while not destined to become a permanent floor in the power plant structure, was on July 14, 1977, a floor on and from which respondent's employees were required to perform various tasks, including inspection, clean-out, and removal of scaffolding welded thereto.

7. Said floor had an open side which was not protected by a standard guardrail, since there was no midrail, the single rail was 5 1/2 inches lower than standard, and the supports were more than 8 feet apart. At least 3 of respondent's employees were exposed to or had access to this hazard.

## CONCLUSIONS OF LAW

On the basis of the foregoing findings of fact, as amplified in the opinion, it is concluded that:

1. The Commission has jurisdiction of the parties and of the subject matter of this proceeding.

2. On July 14, 1977, respondent was in serious violation of §5(a)(2) of the Act and 29 CFR 1926.500(d)(1).

## ORDER

On the basis of the foregoing findings of fact and conclusions of law, it is ORDERED that:

1. Item 1 of citation 1 for serious violation of 29 CFR 1926.500(d)(1) be and it hereby is affirmed and that a penalty of $300 be and it hereby is assessed.

2. This proceeding be and it hereby is terminated.

DEE C. BLYTHE
Administrative Law Judge

| UNITED AUTO WORKERS LOCAL 834 | : | |
| Objector | : | OSHRC |
| | : | DOCKET NO. 82-0337-E |
| V. | : | |
| SECRETARY OF LABOR | : | |
| and | : | |
| HEINTZ DIVISION - KELSEY-HAYES CO. | : | |
| Respondents | : | |

JUDGE'S DECISION JUN 28 '82 RECEIVED

FINAL ORDER ON JUL 28 '82

ORDER

This matter arises under the provisions of the Occupational Safety and Health Act of 1970 (the Act) 29 U.S.C. 651 et seq., upon the objection of Local 834 of the United Auto Workers Union (Union) to an "Informal Settlement Agreement" entered into by the Secretary of Labor through the Area Director for the Occupational Safety and Health Administration for the Philadelphia, Pennsylvania Region (OSHA-Respondent) and the Heintz Division of the Kelsey-Hayes Company, also of Philadelphia, Pennsylvania, (Respondent).

The official Commission Docket File of this case reveals the following:

During the period from January 13, 1982 to February 10, 1982, OSHA inspected a plant operated by Heintz located in Philadelphia, Pennsylvania (R.p. 1).1/

As a result of this inspection, and pursuant to Sections 9 and 10 of the Act, 29 U.S.C. 658 and 659, on February 25, 1982 OSHA issued a one-Itemed Serious Citation to Heintz alleging a violation of Section 5(a)(2) of the Act, U.S.C. 654(a)(2) and the Occupational Safety and Health Standard set forth at 29 C.F.R. 1910.217(b)(10) in that there was water in the pneumatic controlling systems of mechanical power presses in Building 18, Aircraft Department which created a hazard of failure of the controlling systems on these presses. This Citation ordered abatement of this condition by March 15, 1982 and proposed a $500 penalty. (R.p. 1).

On March 9, 1982, within the 15 working day contest period provided for in Section 10(a) of the Act, 29 U.S.C. 659(a), an "informal conference" was held at which representatives of OSHA, Heintz and the Union participated. During this conference the representatives from both Heintz and the Union represented that, as of this conference date, the condition which was the subject of the Citation had been corrected. (R.p. J-2, the OSHA statement filed pursuant to Commission Rule 35, 29 C.F.R. 2200.35

---

1/ References herein are as follows:

R.p. 1 - The first numbered document in Docket file No. 82-337-E prior to assignment of this case to the undersigned.

R.p. J-1 - The first numbered document in this Docket file after assignment to the undersigned.

and an Order entered in this matter on April 13, 1982 (R.P. J-1).

During this "informal conference" on March 9, 1982, the OSHA Area Director Mr. Dillon and the representative of Heintz entered into and executed an "Informal Settlement Agreement", under which the originally proposed penalty of $500 was reduced to $250. (See "Exhibit B", attached to OSHA's Statement, R.p. J-2).

Evidently as a result of this "Informal Settlement Agreement", Heintz did not contest this Citation within the 15 working day contest period, which expired on March 19, 1982.

However, within this contest period, on March 15, 1982, the Union did object to this "Informal Settlement Agreement", alleging that, ". . . the abatement date should have been immediately.", and further, ". . . that OSHA has arbitrarily reduced the penalty from $500 to $250, without allowing the Union time to appeal this decision." (See R.p. 3).

Thereafter this case was referred to and docketed by the Review Commission (R.p. 4) and assigned to the undersigned for determination (R.p. 5).

In its statement filed pursuant to Commission Rule 35 and the Order dated April 13, 1982, the Union states, inter alia;

* * *

> Local 834, United Auto Worker's is contesting the above citation in the matters of abatment [sic] date and penalty. The matter of the abatement date is moot because the citation has been corrected.
>
> We disagree with the reduction of penalty from $500 to $250 which took place in an informal conference in the Philadelphia area office. The reason for our objection is that this condition had occurred numerous times before and has occurred since the citation.

* * *

(R.P. J-3).

## I S S U E

Since the Union readily admits that the question of the reasonableness of the abatement period has become moot because the alleged violative condition has been corrected, the issue presented by this case is whether the Union has the right under Section 10(c) of the Act, 29 U.S.C. 659(c)[2/] to contest the reduction of the penalty in this case.

---

2/ If an employer notifies the Secretary that he intends to contest a citation issued under section 9(a) or notification issued under subsection (a) or (b) of this section, or if, within fifteen working days of the issuance of a citation under section 9(a), any employee or representative of employees files a notice with the Secretary alleging that the period of time fixed in the citation for the abatement of the violation is unreasonable, the Secretary shall immediately advise the Commission of such notification, and the Commission shall afford an opportunity for a hearing (in accordance with section 554 of title 5, United States Code, but without regard to subsection (a)(3) of such section). The Commission shall thereafter issue an order, based on findings of fact, affirming, modifying, or vacating the Secretary's citation or proposed penalty, or directing other appropriate relief, and such order shall become final thirty days after its issuance. Upon a showing by an employer of a good faith effort to comply with the abatement requirements of a citation, and that abatement has not been completed because of factors beyond his reasonable control, the Secretary, after an opportunity for a hearing as provided in this subsection, shall issue an order affirming or modifying the abatement requirements in such citation. The rules of procedure prescribed by the Commission shall provide affected employees or representatives of affected employees an opportunity to participate as parties to hearings under this subsection.

This question has been authoritatively answered in the negative by the United States Court of Appeals for the Third Circuit, in Secretary of Labor v. Sun Petroleum Products Co. et al, 622 F.2d 1176 (3rd Cir., 1980), cert. den., 449 U.S. 1061 (1980).

In that case, involving inter alia, a settlement between OSHA and an employer, the Court held:

* * *

> The Act provides that the Commission is required to afford an opportunity for a hearing upon the happening of either of two events: (1) if the employer notifies the Secretary that he intends to contest a citation, or (2) if "any employee or representative of employees files a notice with the Secretary alleging that the period of time fixed in the citation for the abatement of the violation is unreasonable." 29 U.S.C. § 659(c). If settlement is reached after either of these events occurs, but prior to the scheduled hearing, the ALJ would have jurisdiction to review the settlement, but only for the limited purpose of entertaining objections from the employee or employees' representative that the abatement period proposed by the settlement is unreasonable.
>
> If [sic] follows, then, that if the ALJ had jurisdiction in this case, the Review Commission would have jurisdiction for this same limited purpose-to review the settlement as provided in 29 C.F.R. §§ 2200.91 and 2200.91a. Accordingly, we hold that if no employer notice of contest has been filed, or if an employee or his representative has not filed a notice to challenge the abatement period prior to the time when a settlement is entered into between the Secretary and the cited employer, then the Commission has no jurisdiction to review the settlement; but once either notice has been properly filed, the ALJ and, later, the Review Commission would have jurisdiction to review the settlement to a limited extent, to-wit, to determine whether the time fixed in the citation for the abatement of the violation is unreasonable.
>
> (at 1185)

* * *

Under our interpretation we also reject the union's contention that affected employees have a right to be heard on matters other than the reasonableness of the abatement period. The Senate Committee Report makes clear that section 10(c) "gives an employee or representative of employees a right, whenever he believes that the period of time provided in a citation for abatement of a violation is unreasonably long to challenge the citation on that ground.[17] Moreover, the legislative history discloses no support for the union's position. Indeed, any evidence of congressional intent on this point contradicts the union's assertion that it is entitled to be heard on matters other than the abatement period.[18] We therefore conclude that any challenge advanced by an employee is limited to an attack on the reasonableness of the abatement period.

17/ Legislative History, supra note 6, at 155.

18/ For example, Senator Williams succinctly defined the right of employees to appeal from the issuances of a citation and proposed penalty: "Employees are also given appeal rights when they believe that an unreasonably long period of time has been allowed for abatement of a violation." Legislative History, supra note 6, at 414.

(at 1186)

In this case, the Union admits that the alleged violative condition has been corrected and accurately concludes that thus there is no longer any outstanding issue involving the reasonableness of the abatement period.

Under the binding precedent of the Sun Petroleum case supra,[3] the Union's objection to the reduction in penalty effected in the Settlement Agreement in this case must and the same is, hereby, DENIED.

Because there are no remaining issues, this case is terminated.

SO ORDERED.

William E. Brennan
WILLIAM E. BRENNAN
Judge, OSHRC

Dated: June 28, 1982
New York, New York

---

3/ Since the litigants in this case are located within the geographical limits of the Third Circuit Court of Appeals, that Court's precedent binds the Review Commission and its Judges.
See; Jones & Laughlin Steel Corp., v. Secretary of Labor et al; 636 F.2d 32, 33 (3rd Cir., 1980); Allegheny General Hospital v. NLRB et al., 608 F.2d 965 (3rd Cir., 1979).
Thus, the decision of the United States Court of Appeals for the District of Columbia in Oil, Chemical and Atomic Workers Int'l. Union, and Locals 3-499 et al v. OSHRC, 671 F.2d 643 (D.C Cir., 1982), which is in conflict with the Sun Petroleum case supra, is not the controlling precedent in this case.

| v. | : | OSHRC Docket No. 77-2911 |
| CONSOLIDATED RAIL CORPORATION, | : | |
| Respondent. | : | |

DECISION

Before ROWLAND, Chairman; CLEARY and COTTINE, Commissioners.

BY THE COMMISSION:

A decision of Administrative Law Judge Edward V. Alfieri is before the Commission under section 12(j), 29 U.S.C. § 661(i), of the Occupational Safety and Health Act of 1970, 29 U.S.C. §§ 651-78 ("the Act"). Judge Alfieri found that Consolidated Rail Corporation ("Conrail") was exempt from the recording and reporting requirements of 29 C.F.R. §§ 1904.2, 1904.4, and 1904.5 and therefore was not required to give a compliance officer of the Occupational Safety and Health Administration ("OSHA") access to any records pursuant to 29 C.F.R. § 1904.7,[1/]

---

1/ 29 C.F.R. § 1904.7 provides, in pertinent part:

> Each employer shall provide, upon request, records provided for in §§ 1904.2, 1904.4, and 1904.5, for inspection and copying by any representative of the Secretary of Labor. . . .

Conrail was cited under the 1977 version of this standard, which was substantially the same as the current version set forth here. Section

(continued on next page)

including the safety and health records Conrail kept for the Federal Railway Administration ("FRA").

The Secretary petitioned for review of Judge Alfieri's decision and Commissioners Cleary and Cottine granted the Secretary's petition. We affirm Judge Alfieri's decision to vacate the citation in this case but hold that railroad industry employers must comply with the OSHA recording and reporting requirements and must make their records available to OSHA compliance officers.

In Southern Pacific Transportation Co., 74 OSAHRC 83/A2, 2 BNA OSHC 1313, 1974-75 CCH OSHD ¶ 19,054 (No. 1348, 1974), aff'd, 539 F.2d 386 (5th Cir. 1976), cert. denied, 434 U.S. 874 (1977) ("Southern Pacific"), the Commission held that the Department of Transportation's (FRA's) regulations requiring the reporting of accidents exempted railroad employers from all OSHA recordkeeping regulations under section 4(b)(1) of the Act.[2/] However, in Consolidated Rail Corp., 82 OSAHRC , 10 BNA OSHC 1706, 1982 CCH OSHD ¶ 26,082 (No. 80-3495, 1982), the Com-

---

1/ (continued)

1904.2 requires employers to maintain a log and summary of all recordable occupational injuries and illnesses. An employer may use OSHA form No. 200 or an equivalent. Section 1904.4 requires employers to maintain a supplementary record for each injury or illness, in the detail prescribed in OSHA form No. 101. Again, an employer may use an equivalent form, such as a workmen's compensation form. Section 1904.5 requires employers to post an annual summary of injuries and illnesses using OSHA form No. 200.

2/ Section 4(b)(1), 29 U.S.C. § 653(b)(1), provides in pertinent part,

> Nothing in this chapter shall apply to working conditions of employees with respect to which other Federal agencies . . . exercise statutory authority to prescribe or enforce standards or regulations affecting occupational safety or health.

mission specifically overruled this aspect of Southern Pacific. The Commission held that employers in the railroad industry must comply with OSHA recordkeeping requirements and must afford the Secretary's representatives access to the records they are required to maintain. Thus, by failing to do this, Conrail failed to adhere to section 1904.7.

However, it would be unfair to hold Conrail in violation of the cited regulation in this case since Southern Pacific was the relevant Commission precedent at the time of the alleged violation. See Consolidated Rail Corp., supra. We therefore affirm Judge Alfieri's vacation of the citation but reemphasize that Conrail and other railroad industry employers must maintain suitable records and make them available to OSHA representatives.[4/] SO ORDERED.

FOR THE COMMISSION

Ray H. Darling, Jr.

RAY H. DARLING, JR.
EXECUTIVE SECRETARY

DATED: JUL 29 1982

---

4/ Chairman Rowland would adhere to the holding of Southern Pacific that railroad employers are not required to comply with OSHA recordkeeping requirements. Consolidated Rail Corp., 10 BNA OSHC at 1708 n. 7, 1982 CCH OSHD at p. 32,828 n. 7. The remaining issue presented by this case is whether a railroad employer must afford the Secretary access to the records it maintains for the FRA. In Consolidated Rail Corp., the majority addressed this issue, holding that 29 C.F.R. § 1904.7 requires that railroad employers make available to the Secretary either OSHA records or the equivalent of OSHA records. Thus, the issue has already been decided by the Commission majority. Regardless of how he would decide the issue, Chairman Rowland believes it would be unfair to find Conrail in violation of § 1904.7 in this case, and therefore concurs in the vacation of the citation. Because the Commission majority has already decided the issue and the outcome of the case would not be affected, Chairman Rowland does not decide whether § 4(b)(1) precludes the Secretary from obtaining access to the FRA accident and illness records maintained by a railroad employer.

## DECISION AND ORDER

Edward V. Alfieri, Judge

## STATEMENT OF THE CASE

This is a proceeding under section 10 of the Occupational Safety and Health Act of 1970 (29 U.S.C. 651 *et seq.*) contesting

an other than serious citation issued on July 7, 1977, by the Secretary against the Respondent under the authority vested in the Secretary by section 9(a) of the Act (29 U.S.C. 658(a)).

Respondent is alleged to have failed to comply with regulation 29 CFR 1904.7 entitled Access to Records. In pertinent part it reads:

> Records provided for in §§ 1904.2, 1904.4, and 1904.5 shall be available for inspection and copying by Compliance Safety and Health Officers of the Occupational Safety and Health Administration, U.S. Department of Labor during any occupational safety and health inspection provided for under Part 1903 of this chapter and section 8 of the at . . . .

Respondent's infraction is described as follows:

> Records provided for in 29 CFR 1904.2, 1904.4, and 1904.5 were not available for inspection and copying by the compliance safety and health officer of the Occupational Safety and Health Administration: (Emphasis added)

At the hearing the parties agreed upon the following statement of facts.

On June 29, 1977 compliance officer Eugene Drager appeared at the Respondent's office located at 466 Lexington Avenue, New York City, New York. Drager asked to see the records relating to occupational safety and health. Respondent refused to show its records (Tr. 16-17).

It was further agreed that if called to testify Respondent's chief clerk, Agnes Robb, would have testified that such records are kept pursuant to Federal Railroad Administration Rules (Tr. 17-18).

## DISCUSSION

The Commission has ruled that the railroad industry is subject to the Federal Railroad Administration Accident/Incident reporting requirements[1/] and is, therefore, not subject to equivalent Occupational Safety and Health Administration Rules.[2/] Secretary v. Southern Pacific Transportation Company,[3/] 2 OSHC 1313 (OSAHRC Docket No. 1348, 1974).

In view of that ruling Respondent is not required to have available for the Secretary records provided for by specific OSHA regulations from which Respondent is exempt. Accordingly, the citation must be vacated.

It is not foreign to this case to observe that the Respondent is not charged with failing to have accessable to the Secretary, records that are equivalent to OSHA records. Had that been the basis for the citation there would have been more merit to the Secretary's right to examine the records for statistical and information purposes (Secretary's brief, p.11).

---

1/ FRA Regulation 49 CFR 225.
2/ OSHA Regulation 29 CFR 1904, et seq.
3/ Dissent by Commissioner Cleary.

## CONCLUSIONS OF LAW

1. Respondent is, and at all times material hereto was, engaged in a business affecting commerce within the meaning of section 3(5) of the Occupational Safety and Health Act.

2. Respondent is exempt from the recording and reporting occupational injuries and illnesses regulations 29 CFR 1904, *et seq*.

3. Respondent is not required to comply with 29 CFR 1904.7.

## O R D E R

The citation is vacated.

| SECRETARY OF LABOR, | : | |
| Complainant, | : | |
| v. | : | OSHRC Docket No. 77-4143 |
| DILLINGHAM TUG AND BARGE CORPORATION, | : | |
| Respondent. | : | |

DECISION

Before ROWLAND, Chairman; CLEARY and COTTINE, Commissioners.

BY THE COMMISSION:

Following an accident that resulted in the death of one of Dillingham Tug & Barge Corporation's seamen, the Secretary of Labor cited Dillingham for allegedly violating section 5(a)(1)[1/] of the Occupational Safety and Health Act of 1970[2/] ("the Act" or "the OSH Act"). Dillingham contends that the Secretary lacks jurisdiction over the working conditions of seamen, and that pursuant to section 4(b)(1) of the Act,[3/]

---

1/ Section 5(a)(1), 29 U.S.C. § 654(a)(1), provides:

> Sec. 5.(a) Each employer—
> (1) shall furnish to each of his employees employment and a place of employment which are free from recognized hazards that are causing or are likely to cause death or serious physical harm to his employees.

2/ 29 U.S.C. §§ 651-678.

3/ Section 4(b)(1), 29 U.S.C. § 653(b)(1), provides in pertinent part:

> Nothing in this chapter shall apply to working conditions of employees with respect to which other Federal agencies . . . exercise statutory authority to prescribe or enforce standards or regulations affecting occupational safety or health.

the Secretary was precluded from issuing the citation by virtue of Coast Guard regulation of the cited working condition. Administrative Law Judge Jerry W. Mitchell rejected Dillingham's arguments and affirmed the citation.[4/] Dillingham filed a petition asking the Commission to review the judge's decision. Pursuant to section 12(j) of the Act, 29 U.S.C. § 661(1), former Commissioner Barnako directed review on the following issue:

> Whether the administrative law judge erred in concluding that the U. S. Coast Guard did not exercise statutory authority to prescribe or enforce standards or regulations affecting occupational safety or health respecting the working conditions involved herein, and therefore that Respondent Dillingham Tug & Barge Corporation was not exempt from the requirements of the Act.

For the reasons that follow, we reverse the judge's decision and vacate the citation.

I

Dillingham provides towboat services to vessels in the navigable waters surrounding Hawaii. On July 3, 1977, two towboats owned and operated by Dillingham, the MAPU and the MA'A, were assigned to help moor an oil tanker, the AEGEAN ISLAND, at an anchorage approximately two miles offshore from Barbers Point, Oahu, Hawaii.

To accomplish the mooring operation, the towboats had to run lines from the AEGEAN ISLAND to certain mooring buoys located in the anchorage. Some of the mooring lines were secured without difficulty. Two of the lines, however, proved to be too short to reach the appropriate buoys.

---

4/ Dillingham and the Secretary entered into a partial settlement agreement by which, if Dillingham's arguments relating to the Secretary's authority to issue the citation were rejected, the citation would be affirmed.

To secure these lines, the MAPU pushed the buoys toward the MA'A, which held the lines that ran from the AEGEAN ISLAND. A seaman on board the MAPU, Francis Kane, then boarded the buoys to assist the crew of the MA'A to secure the lines. After the lines were secured, the MAPU proceeded to the final buoy so that Kane could again come on board. When the MAPU was near the buoy, Kane lost his balance, fell from the buoy, and was crushed between the MAPU and the buoy. The Coast Guard investigated the incident and found no evidence that it involved any violation of law or regulation. The Secretary also conducted an investigation and cited Dillingham for allegedly violating section 5(a)(1) of the OSH Act.

II

In Puget Sound Tug & Barge, 81 OSAHRC 50/A2, 9 BNA OSHC 1764, 1981 CCH OSHD ¶ 25,373 (No. 76-4905, 1981),[5/] a divided Commission rejected the argument that section 4(b)(1) precludes the Secretary of Labor from citing an employer for alleged violations of the OSH Act that involve the working conditions of seamen aboard vessels on navigable waters. The majority viewed this argument as seeking an "industry-wide exemption" from the Act and rejected the argument on the basis of precedent holding that "section 4(b)(1) was not designed to create industry-wide exemptions, but rather exemptions only over those working conditions that have been the subject of an exercise of another agency's statutory authority to regulate occupational safety and health." 9 BNA OSHC at 1775, 1981 CCH OSHD at p. 31,595. The majority cited, among other

---

5/ Appeals filed, Nos. 81-7405 and 81-7406 (9th Cir. June 26, 1981); No. 81-4243 (5th Cir. June 24, 1981).

cases, Southern Pacific Transportation Co. v. Usery, 539 F.2d 386 (5th Cir. 1976), cert. denied, 434 U.S. 874 (1977), and Southern Railway Co. v. OSHRC, 539 F.2d 335 (4th Cir.), cert. denied, 429 U.S. 999 (1976). Thus, although acknowledging that the Coast Guard possessed broad statutory authority to issue regulations promoting safety on navigable waters and that the Coast Guard had issued regulations pursuant to this authority, the majority concluded that the Coast Guard's exercise of authority did not entirely exempt from the Act the working conditions of seamen aboard vessels on navigable waters. Instead, the majority concluded that section 4(b)(1) only precluded the Secretary from citing those specific working conditions that were the subject of applicable Coast Guard regulations. In dissent, Commissioner Cleary rejected what he referred to as the majority's "nook and cranny" theory. He believed that the Coast Guard's regulations affecting the working conditions of seamen were so comprehensive that it would impair, if not destroy, the fabric of the Coast Guard's regulatory scheme to apply OSHA standards to situations for which the Coast Guard lacked applicable regulations. 9 BNA OSHC at 1782, 1981 CCH OSHD at p. 31,601.

We have reconsidered the Commission's holding in Puget Sound.[6/] We conclude that section 4(b)(1) in certain circumstances can create industry-wide exemptions from the OSH Act. Having examined the manner in which the Coast Guard has exercised its statutory authority to regulate the health

---

6/ Puget Sound involved vessels inspected and certificated by the Coast Guard, while the vessel in this case, the tugboat MAPU, was not so inspected and certificated. As pointed out later in this opinion, however, the Coast Guard has issued regulations directed at the protection of seamen for uninspected vessels as well as for vessels it inspects and certificates. Thus, there is no distinction between uninspected vessels and inspected and certificated vessels for the purpose of this case.

and safety of seamen aboard vessels operating on navigable waters, we conclude that section 4(b)(1) precludes the Secretary from enforcing the OSH Act with respect to such working conditions. We overrule Puget Sound to the extent it is inconsistent with this holding.

III

Coast Guard regulations applicable to maritime operations are found in 46 C.F.R., Chapter I. These regulations were promulgated pursuant to the Coast Guard's statutory authority to promote safety on the navigable waters of the United States. See Puget Sound, 9 BNA OSHC at 1773-74, 1981 CCH OSHD at pp. 31,593-94. Chapter I contains a number of subchapters, some of which apply to specific types of vessels and some of which apply to other subjects. The following list of the subchapter titles generally illustrates the Coast Guard's regulatory scheme.

| Subchapter | Title |
|---|---|
| A | Procedures Applicable to the Public |
| B | Merchant Marine Officers & Seamen |
| C | Uninspected Vessels |
| D | Tank Vessels |
| E | Load Lines |
| F | Marine Engineering |
| G | Documentation and Measurement of Vessels |
| H | Passenger Vessels |
| I | Cargo and Miscellaneous Vessels |
| I-A | Mobile Offshore Drilling Units |
| J | Electrical Engineering |
| L-M | Reserved |

| | |
|---|---|
| N | Dangerous Cargoes |
| O | Certain Bulk Dangerous Cargoes |
| P | Manning of Vessels |
| Q | Equipment, Construction, and Materials: Specifications and Approval |
| R | Nautical Schools |
| S | Reserved |
| T | Small Passenger Vessels (under 110 gross tons) |
| U | Oceanographic Vessels |
| V | Marine Occupational Safety and Health Standards[7/] |

As noted above, Dillingham's tugboat, the MAPU, was not inspected and certificated by the Coast Guard. The regulations in Subchapter C, entitled "Uninspected Vessels," apply to all vessels except those covered by the other subchapters of 46 C.F.R., Chapter I. 46 C.F.R. § 24.05-1(a) and accompanying Table 24.05-1(a). The only exceptions are vessels operating exclusively on inland waters which are not navigable waters of the United States, vessels while laid up and dismantled and out of commission, and certain vessels with title vested in the United States and used for public purposes. 46 C.F.R. § 24.05-1(a). Thus, any vessel not owned by the United States and operating on navigable waters is covered by Coast Guard regulations under either Subchapter C or some other subchapter of 46 C.F.R., Chapter I.[8/]

---

7/ This subchapter applies to commercial diving operations.

8/ Relying on Coast Guard statements, in a Memorandum of Understanding with OSHA and in an advance notice of proposed rulemaking for diving standards, that the Coast Guard has statutory authority to regulate the working conditions of employees on vessels subject to Coast Guard inspection and

(Continued on next page)

An examination of the regulations in Subchapter C indicates that the Coast Guard has made provision for protection against a variety of hazards that may arise in the operation of uninspected vessels. Among

---

8/ (Continued)

certification, the dissenting opinion suggests that the Coast Guard itself recognizes OSHA jurisdiction over uninspected vessels. We do not draw the same conclusion from these statements.

The Coast Guard unquestionably has specific statutory authority to inspect and certify certain types of vessels and to issue regulations governing such vessels. See 46 U.S.C. §§ 361-436. Various subchapters of 46 C.F.R., Chapter I deal exclusively with inspected and certificated vessels. However, the Coast Guard's reliance on its authority over inspected vessels to undertake certain regulatory activities does not imply that it believes it has no authority over uninspected vessels. The Coast Guard has statutory authority to "promulgate and enforce regulations for the promotion of safety of life and property on and under the high seas and waters subject to the jurisdiction of the United States covering all matters not specifically delegated by law to some other executive department . . . ." 14 U.S.C. § 2. The Coast Guard's general statutory authority thus extends to all vessels in navigation. Cf. Foremost Insurance Co. v. Richardson, 50 U.S.L.W. 4778, 4780-81 (June 23, 1982) (Coast Guard regulations designed to prevent collisions on navigable waters apply to all vessels without regard to their commercial or noncommerical nature). Moreover, the reference in the Memorandum of Understanding to the Secretary's maritime jurisdiction may simply be in recognition of the undisputed fact that the Secretary has jurisdiction over certain types of maritime work, such as longshoring and shipbuilding. See Atlantic & Gulf Stevedores, Inc. v. OSHRC, 534 F.2d 541 (3d Cir. 1976) (application of OSHA standard to longshoring operation); Bethlehem Steel Corp., 82 OSAHRC , 10 BNA OSHC 1673, 1982 CCH OSHD ¶ 26,083 (No. 77-1807, 1982) (application of OSHA shipbuilding standards).

The dissent also suggests that our decision renders a nullity an agreement between the Coast Guard and OSHA concerning the enforcement of OSHA diving standards. This case does not involve diving standards and we have no occasion to consider whether or under what circumstances OSHA can enforce such standards. The dissent takes note of cooperation between the Coast Guard and OSHA, and suggests that this mechanism for resolving 4(b)(1) conflicts will be threatened by our decision. We note that if any significant degree of cooperation existed between agencies on the matters at hand, we would expect the Commission to be so advised. Since neither agency has advised the Commission of any such understanding, we must assume that recently developed memoranda of understanding are irrelevant to this litigation. In any event, it is our statutory responsibility to decide whether private employers have violated the Act as alleged by the Secretary, and agreements or cooperation between OSHA and other agencies cannot detract from an employer's right to have its section 4(b)(1) claim adjudicated by the Commission.

the subjects regulated are navigation; ventilation; fire protection equipment; life preservers and other lifesaving equipment; the design, construction, and testing of boilers and machinery; liquified petroleum gas; backfire flame arrestors for gasoline engines; safety orientation and emergency instructions; and pilot ladders. In addition, various provisions of other subchapters, such as Subchapter P - entitled "Manning of Vessels" - apply to uninspected vessels as well as to other types of vessels. Moreover, the Coast Guard's authority to investigate maritime accidents and to enforce its regulations applies to uninspected vessels, as illustrated by the Coast Guard investigation that followed the accident involved in this case. See 33 C.F.R. § 1.07-10. Thus, the Coast Guard has prescribed, and it enforces, regulations that govern the working conditions of seamen aboard both inspected and uninspected vessels operating on navigable waters.

IV

Prior to the OSH Act's passage, Congress had given authority to regulate particular working conditions to federal agencies other than the Secretary of Labor.[9/] Congress believed that it would be beneficial to employee safety and health if agencies that had specialized expertise in regulating particular working conditions continued to do so. Thus, Congress intended that other agencies that had been given statutory authority to regulate occupational safety and health would be the

---

9/ For example, prior to the passage of the OSH Act, Congress had enacted the Federal Coal Mine Health and Safety Act of 1969 and the Federal Metal and Nonmetallic Mine Safety Act, both of which were administered by the Department of the Interior. These statutes have since been superseded by the Federal Mine Safety and Health Act of 1977, 30 U.S.C. §§ 801-960, which is administered by the Department of Labor.

dominant agencies in their particular areas, with the OSH Act applying only insofar as the other agencies had not exercised their statutory authority. See Southern Pacific Transportation Co. v. Usery, supra, 539 F.2d at 391-92.

As discussed above, the Coast Guard has issued extensive regulations applicable to all vessels operating on navigable waters except certain vessels owned by the United States. The Coast Guard regulations are directed at protecting the health and safety of seamen. Taylor v. Moore-McCormick Lines, Inc., 621 F.2d 88 (4th Cir. 1980); Clary v. Ocean Drilling and Exploration Co., 609 F.2d 1120 (5th Cir. 1980). Thus, employers of seamen, such as Dillingham, must look to the Coast Guard regulations for the requirements they must comply with to protect their employees. Under the approach of the majority in Puget Sound, such employers would also be required to compare the Coast Guard regulations with OSHA regulations, determine which conditions of the work environment are not addressed by Coast Guard regulations, and comply with OSHA requirements directed at those working conditions. This approach necessarily assumes that the Coast Guard regulations are insufficient to provide adequate protection to seamen aboard vessels on navigable waters. It is thus inconsistent with the established rule that section 4(b)(1) does not permit an inquiry into the stringency of another agency's exercise of authority. "Once another Federal agency exercises its authority over specific working conditions, OSHA cannot enforce its own regulations covering the same conditions. Section 4(b)(1) does not require that another agency exercise its authority in the same manner or in an equally stringent manner." Mushroom Transportation Co., 73 OSAHRC 51/E10, 1 BNA OSHC 1390, 1392, 1973-74 CCH OSHD ¶ 16,881 at p. 21,591 (No. 1588, 1973).

See also Northwest Airlines, Inc., 80 OSAHRC 87/B5, 8 BNA OSHC 1982, 1990, 1980 CCH OSHD ¶ 24,751 at p. 30,489 (No. 13649, 1980); Pennsuco Cement and Aggregates, Inc., 80 OSAHRC 47/A2, 8 BNA OSHC 1378, 1980 CCH OSHD ¶ 24,478 (No. 15462, 1980).

The Puget Sound majority's approach also places an unreasonable burden on employers to determine the requirements with which they must comply. As Commissioner Cleary stated in his separate opinion:

> Such an approach also creates a regulatory labyrinth for employers who must review two sets of federal regulations in detail to determine where there are voids in one set of regulations which are susceptible to application of a standard from another set of regulations. In the ensuing uncertainty the goal of providing employees with a safe and healthful workplace can only suffer.

9 BNA OSHC at 1782, 1981 CCH OSHD at p. 31,601.

This case involves an alleged hazard to a seaman arising out of activities aboard a vessel operating on navigable waters. The Coast Guard, an agency with special expertise in maritime hazards, has exercised its statutory authority to prescribe standards and regulations governing the working conditions of seamen. Thus, the Secretary is precluded from enforcing the OSH Act with respect to those working conditions. Moreover, we note that the Coast Guard investigated the incident that led to this case and determined that it did not involve any violation of law or regulation. Nevertheless, the Coast Guard investigation resulted in the recommendation of measures intended to avoid similar incidents in the future.[10/] Thus, the dominant agency in maritime safety

---

10/ The dissenting opinion suggests that the Coast Guard's investigation may have been an exercise of its deepwater port jurisdiction rather than its jurisdiction over uninspected vessels. However, the fact that the Coast Guard was able to address the broader problem that the fatal incident revealed does not suggest that it lacks jurisdiction over the cited working condition. If anything, it demonstrates that the Coast Guard is better able than OSHA to focus on the overall problem of safety on navigable waters due to its broad statutory authority over the subject.

has taken remedial action. Permitting the Secretary to also seek remedial measures through an enforcement action arising out of the same incident would thus result in the very duplication of federal agency effort that section 4(b)(1) is designed to avoid. See Southern Railway Co. v. OSHRC, supra, 539 F.2d at 339; Organized Migrants in Community Action, Inc. v. Brennan, 520 F.2d 1161, 1167 (D.C. Cir. 1975).

The section 5(a)(1) citation is vacated. SO ORDERED.

FOR THE COMMISSION

Ray H. Darling, Jr.

RAY H. DARLING, JR.
EXECUTIVE SECRETARY

DATED: JUL 29 1982

COTTINE, Commissioner, dissenting:

Section 4(b)(1) of the Act, 29 U.S.C. § 653(b)(1),[1/] provides that OSHA is without authority to regulate working conditions covered by another agency when the other agency exercises its "statutory authority to prescribe or enforce standards or regulations affecting occupational safety and health." Until recently,[2/] the Commission has consistently required that the standards and regulations promulgated by another federal agency address the particular cited working conditions and have the "force and effect of law" in order to preempt OSHA jurisdiction.[3/]

As I noted in my separate opinion in Consolidated Rail Corp., OSAHRC , 10 BNA OSHC 1577, 1982 CCH OSHD ¶26,044 (No. 79-1277, 1982), petition for review filed, No. 82-3302 (3d Cir. June 28, 1982),

> Congress did not envision a perfunctory preemption of the Act's application under section 4(b)(1). It was well aware that there were other federal agencies concerned with safety and intimately familiar with the regulated industry. Nonetheless, Congress delegated authority for safety and health to OSHA in the absence of an exercise by a sister agency. Congress also provided the Commission with a statutory rule to assess the existence of another agency's exercise.

10 BNA OSHC at 1583, 1982 CCH OSHD at p. 32,711. I further noted that

---

1/ Section 4(b)(1) states, in pertinent part, the following:

> Nothing in this Act shall apply to working conditions of employees with respect to which other Federal agencies. . . exercise statutory authority to prescribe or enforce standards or regulations affecting occupational safety or health.

2/ See Consolidated Rail Corp., OSAHRC , 10 BNA OSHC 1577, 1982 CCH OSHD ¶26,044 (No. 79-1277, 1982), petition for review filed, No. 82-3302 (3d Cir. June 28, 1892).

3/ E.g., Puget Sound Tug & Barge Co., 81 OSAHRC 50/A2, 9 BNA OSHC 1764, 1981 CCH OSHD ¶25,373 (Nos. 76-4905 et al., 1981), appeals filed, No. 81-7406 (9th Cir. June 26, 1981)(OSHRC Docket No. 76-4905), No. 81-7405 (9th Cir. June 26, 1981)(OSHRC Docket No. 76-5515), and No. 81-4243 (5th Cir. June 24, 1981)(OSHRC Docket No. 78-617) ("Coast Guard cases"); Northwest Airlines, Inc., 80 OSAHRC 87/B5, 8 BNA OSHC 1982, 1980 CCH OSHD ¶24,751 (No. 13649, 1980), appeal dismissed, No. 80-4222 (2d Cir. Mar. 31, 1981).

Congress recently reiterated its understanding of section 4(b)(1):

> OSHA's standards do not apply when another agency issues standards which affect occupational safety and health and which have the force and effect of law.
>
> House Comm. on Gov't Operations, Occupational Safety and Health Protection for Aviation Industry Employees--The Conflict Between FAA and OSHA, H.R. REP. No. 393, 97th Cong., 1st Sess. 2 (1981)(Emphasis added).

10 BNA OSHC at 1583 n., 1982 CCH OSHD at p. 32,711 n.

The burden of establishing a section 4(b)(1) exemption rests with the party claiming its application. See Puget Sound Tug & Barge Co., 81 OSAHRC 50/A2, 9 BNA OSHC 1764, 1981 CCH OSHD ¶25,373 (Nos. 76-4905 et al., 1981), and cases cited. The Respondent has not shown that the Coast Guard has the statutory authority to prescribe or enforce standards or regulations with respect to working conditions of employees aboard uninspected vessels other than certain specific conditions regulated by statute,[4/] none of which are relevant to the cited condition in this case. Furthermore, the Coast Guard's general authority to investigate marine casualties does not constitute prescription or enforcement of "standards" or "regulations" within the meaning of section 4(b)(1). Puget Sound Tug & Barge Co., supra. Accordingly, my colleagues err in concluding that pursuant to section 4(b)(1) of the Act OSHA is precluded from enforcing the Act with respect to any working conditions aboard vessels in general and the cited working conditions on this vessel in particular.

---

4/ See note 7, infra.

In recognition of their overlapping authority, the Coast Guard and OSHA have established a cooperative relationship to resolve jurisdictional conflicts. See Part I, infra. The Commission reorders that relationship and leaves certain employees without the protection of any federal safety program in direct conflict with the Act's stated policy of assuring "so far as possible every working man and woman in the nation safe and healthful working conditions," 29 U.S.C. § 651(b).

I

A.

My colleagues improperly rely on 14 U.S.C. § 2 as support for their conclusion that the Coast Guard has general regulatory authority over uninspected vessels. Since its inception in 1915 the Coast Guard has gradually acquired responsibilities previously assigned to other departments and agencies, including those vessel inspection duties once performed by the Bureau of Marine Inspection and Navigation. See 14 U.S.C.A. § 2 (1956)(Historical Note). Until it was abolished in 1946 the Bureau of Marine Inspection and Navigation conducted statutorily required inspections of vessels. Pacific Shrimp Co. v. United States Dept. of Transportation, 375 F.Supp. 1036, 1040 (W.D. Wash. 1974). Since that time, vessel inspections have been conducted by the Coast Guard. In 1949, Congress for the first time set forth a codification of the primary functions and responsibilities of the Coast Guard. 14 U.S.C. § 2 lists these primary duties. Id. The purpose of 14 U.S.C. was "to have outlined in general terms in one section the broad scope of the functions of the Coast Guard." Id. However, it is Title 46 of the U.S. Code that contains the "comprehensive pattern of federal legislation designed to insure the safety of marine equipment" and defines the vessels covered by its provisions. United States v. Gahagan Dredging Corp., 289 F.2d 639, 642 n. 6

(2d Cir. 1961). "As is apparent on the face of the legislation . . . the purpose of the federal inspection statutes is to insure the seagoing safety of vessels subject to inspection." Huron Portland Cement Co. v. City of Detroit, 382 U.S. 440, 445 (1960).[5/]

Federal inspection of steam vessels was begun in 1838 as a result of a series of disastrous boiler explosions. Id.; S. Rep. No. 886, 96th Cong., 2d Sess. 3292, 3293, reprinted in 1980 U.S. CODE CONG. & AD. NEWS 3292, 3393. In 1936, with the enactment of 46 U.S.C. § 367, diesel propelled seagoing vessels of 300 gross tons and over were made subject to the vessel inspection laws. Pacific Shrimp Co. v. United States, 375 F.Supp. at 1040. The vessel involved in this case is a diesel propelled, 33 gross ton tugboat that is not subject to the federal inspection requirements. Cf. Cargo Carriers, Inc. v. Humphrey, 206 F.2d 488 (D.C. Cir. 1953), aff'g Cargo Carriers, Inc. v. Snyder, 104 F.Supp. 258 (D.D.C. 1952). As the D.C. Circuit observed, the purpose of vessel inspection laws is to promote safety at sea and the Coast Guard may properly treat a non-propelled tank barge attached to a 99 ton tugboat as a single unit, so as to impose safety requirements that would be inapplicable to either unit alone. 206 F.2d at 489.

---

5/ The Court's recent decision in Foremost Insur. Co. v. Richardson, 50 U.S.L.W. 4778 (U.S. June 23, 1982), deals with a wrongful death action arising from the collision of two private pleasure boats on navigable waters. The Court simply concluded that the cause of action states a claim within the admiralty jurisdiction of the federal courts. None of the Court's references to the federal "Rules of the Road" promulgated by the Coast Guard, the standards adopted under the Motor Boat Act, or the holding that these regulations are universally applicable to commercial and non-commercial vessels, 50 U.S.L.W. at 4780-1, has any relevance to this case.

B.

The parties do not dispute the fact that the vessel involved in this case is not an inspected and certificated vessel. Accordingly, it is unnecessary in this case to reconsider the primary issue in Puget Sound Tug & Barge Co., regarding whether the Coast Guard's exercise of its authority over inspected and certificated vessels is pre-emptive under section 4(b)(1). Nevertheless, my colleagues have overruled Puget Sound and have created an industrywide exemption that is broad enough to encompass even vessels not subject to the Coast Guard's safety regulations for inspected and certificated vessels.

According to a Memorandum of Agreement between OSHA and the Coast Guard on the development of occupational health standards for workplaces aboard inspected vessels,

> The Commandant of the U.S. Coast Guard has statutory authority, under the Marine Inspection Laws, to promulgate and enforce safety and health standards regarding working conditions of employees on vessels subject to Coast Guard inspection and certification.

45 Fed. Reg. 14739 (1980)(Emphasis added). Furthermore, according to the Department of Transportation,

> Under 46 U.S.C. 391, with 46 U.S.C. 375 and 416, the Coast Guard is to issue regulations to ensure that inspected vessels have a "structure suitable for service," and "suitable accommodations" for passengers and crew and are, "in a condition to warrant the belief she may be used in navigation * * * with safety to life." . . . Therefore diving regulations for inspected vessels under these mandates would include rules for equipment and working conditions.

41 Fed. Reg. 29151, 29152 (1976)(advance notice of proposed rulemaking for commercial diving from vessels and structures that are under Coast Guard jurisdiction)(Emphasis added). However, according to the Commission majority in this case,

> The Coast Guard has prescribed, and it enforces, regulations that govern the working conditions of seamen aboard both inspected and uninspected vessels operating on navigable waters. (Emphasis added.)

My colleagues' holding assigns to the Coast Guard a much wider authority with respect to vessel safety than the Coast Guard has actually asserted.[6/]

According to the Department of Transportation,

> The Coast Guard has extensive authority to regulate safety of life and property on vessels certified by the Coast Guard. . . Vessels under Coast Guard jurisdiction include vessels required to be certificated by the Coast Guard, regardless of their geographic location, including mobile offshore, semi-submersible drilling units. Facilities [under Coast Guard jurisdiction] include deepwater ports . . . .

40 Fed. Reg. 33681 (1975)(advance notice of proposed rulemaking for marine occupational safety and health standards for vessels and facilities under Coast Guard jurisdiction)(Emphasis added); see also 41 Fed. Reg. 29151, 29152 (1976)(DOT advance notice of proposed rulemaking for commercial

---

6/ In determining the extent of an agency's statutory authority to regulate the safety and health of employees, the Commission must give deference to the agency's reasonable interpretation of its own enabling legislation. Northwest Airlines, Inc., 8 BNA OSHC at 1988, 1980 CCH OSHD ¶24,751 at p. 30,487. Although in Puget Sound the Coast Guard claimed it was vested with "regulatory jurisdiction over inspected vessels", Coast Guard Brief at 5, it specifically disavowed sole regulatory jurisdiction over other vessels. At the oral argument in the Puget Sound case on April 17, 1979, the following dialogue was recorded:

> CHAIRMAN CLEARY: Would you claim sole jurisdiction over safety and health on all vessels?
>
> LT. WOEPPEL: No. As I started out, inspected vessels are solely what I'm dealing with --
>
> CHAIRMAN CLEARY: Inspected vessels.

Transcript at 66. The Coast Guard representative further stated, with respect to the Coast Guard's interpretation of its regulatory authority:

> LT. WOEPPEL: . . . [I]t doesn't involve a lot of statutory interpretation or the agency or the Department doesn't have to do a lot of work in order to determine if these vessels are subject to regulation. The statutes are clear on what they cover in terms of types of vessels.

Transcript at 58.

diving from vessels and structures that are under Coast Guard jurisdiction). Nevertheless, my colleagues conclude the following:

> [t]he Coast Guard has issued extensive regulations applicable to all vessels operating on navigable waters except certain vessels owned by the United States. [Emphasis added.]

In a "Memorandum of Agreement on Occupational Health Standards for Workplaces Aboard Inspected Vessels" issued jointly by OSHA and the Coast Guard, the agencies stated:

> Because both USCG and OSHA have statutory authority within the maritime industry, cooperation between the agencies is essential in the area of health standards development.

45 Fed. Reg. 14739 (1980). However, according to the Commission majority,

> The Coast Guard, an agency with special expertise in maritime hazards, has exercised its statutory authority to prescribe standards and regulations governing the working conditions of seamen. Thus, the Secretary is precluded from enforcing the OSH Act with respect to those working conditions.

In Puget Sound, the Commission accepted the Coast Guard's amicus argument that pursuant to its statutory authority the Coast Guard has developed its own regulatory scheme to promulgate and enforce standards regarding working conditions on vessels subject to Coast Guard inspection and certification.[7/] The Coast Guard cases involved inspected and certificated vessels. This case does not involve an inspected and certificated vessel and, according to the Coast Guard's statement of authority and its enforcement activity, the vessel is not subject to the Coast Guard's general safety inspection and enforcement program.[8/]

---

7/ The uninspected vessel regulations in 46 C.F.R. Chap. 1, subchap. C do not derive from the Coast Guard's general authority to prescribe regulations for promotion of "safety to life" under 46 U.S.C. §§ 391 & 395. Rather, they apply a limited number of specific uniform boating standards for all vessels pursuant to the Congressional directives set forth in the Federal Boat Safety Act of 1971, 46 U.S.C. §§ 1451-1489, and the Motorboat Act of 1940, as amended, 46 U.S.C. §§ 526-526(t), that certain specific conditions be uniformly regulated for all vessels, e.g. fire protection and lifesaving appliances. See 46 C.F.R. §§ 24.01-1 and 24.01-10.

8/ See Puget Sound Tug & Barge Co., supra; 45 Fed. Reg. 13739 (1980); 41 Fed. Reg. 29151, 29152 (1976); 40 Fed. Reg. 33681 (1975).

II

The narrow question presented by this case is whether the casualty and accident reporting requirements for uninspected vessels set forth at 33 C.F.R. Part 173 and the Coast Guard's general authority to investigate fatalities under 49 U.S.C. § 239 are preemptive "standards or regulations affecting occupational safety or health" within the meaning of section 4(b)(1).

The Coast Guard's post-accident authority to investigate marine casualties does not constitute prescription or enforcement of "standards" or "regulations" having the force and effect of law within the meaning of section 4(b)(1).[9/] Puget Sound Tug & Barge Co., supra; see Consolidated Rail Corp., supra (Cottine, Commissioner, dissenting in part and concurring in part); Northwest Airlines, Inc., supra.[10/] Furthermore, it is anomalous to conclude that Congress intended the Act's enforcement to be preempted by a sister agency's limited authority to investigate the cause of injuries or fatalities at a worksite and recommend safety measures when "the goal of the Act is to prevent the first accident, not to serve as a source of consolation for the first victim or his survivors." Mineral Industries & Heavy Constr. Group v. OSHRC, 639 F.2d 1289, 1294 (5th Cir. 1981), cited in Faultless Div., Bliss & Laughlin Indus., Inc., No. 81-1740, slip op. at 12 (7th Cir. Mar. 30, 1982).

---

9/ Contra Dunlop v. Avondale Shipyards, Inc., No. 75-1874 (E.D.La. 1976)(3 BNA OSHC 1950, 1975-76 CCH OSHD ¶20,415); see Taylor v. Moore-McCormack Lines, Inc., 621 F.2d 88 (4th Cir. 1980); Clary v. Ocean Drilling & Exploration Co., 609 F.2d 1120 (5th Cir. 1980.

10/ The majority concludes that the investigation following the fatality in this case illustrates that the Coast Guard's authority to investigate accidents and enforce regulations applies to uninspected vessels. However, my colleagues fail to note that the Respondent did not participate in the investigation beyond the filing of the accident report. It is just as likely that the Fourteenth Coast Guard District was exercising its deep-water port safety jurisdiction, see 41 Fed. Reg. 29151, 29152 (1976); 40 Fed. Reg. 33681 (1975), over the HIRI Anchorage in the Pacific Ocean off Barbers Point, Oahu, Hawaii. See 33 C.F.R. §§ 3.70, 110.236.

(Continued on next page)

III

A.

The mere potential for duplicative or conflicting enforcement activity does not preempt OSHA jurisdiction. Instead, other mechanisms exist for cooperative resolution of conflicts resulting from overlapping jurisdiction and apparently have been employed by OSHA and the Coast Guard on more than one occasion. For example, in recognition of OSHA's general safety and health authority under the Act and the Coast Guard's authority under the Marine Inspection Laws over vessels subject to inspection and certification, the two agencies entered into a "Memorandum of Agreement on Occupational Health Standards for Workplaces Aboard Inspected Vessels." 45 Fed. Reg. 14739 (1980). Second, appended to OSHA's Emergency Temporary Standard on Diving Operations, 29 C.F.R. § 1910.401 (1977), 41 Fed. Reg. 24272 (1976), was a Memorandum of Understanding between OSHA and the Coast Guard providing for joint inspection of inspected vessels, enforcement of OSHA diving standards pursuant to the Act, joint rulemaking procedures for permanent standards, and termination of the Memorandum of Understanding upon the effective date of Coast Guard diving standards. Id. at 24291 app. 11/ On July 22, 1977, OSHA published its final commercial diving standards. 42 Fed. Reg. 37668 (1977).

---

10/ (Continued)

The record in this case indicates that the focus of the Coast Guard investigation was the moorings at the HIRI anchorage. Following the fatality a meeting on safety measures at the moorings was held by the Coast Guard Marine Safety Division and attended by HIRI representatives. Subsequently, the Coast Guard Commandant corresponded with the operator of the moorings and HIRI's parent company, Pacific Resources, Inc., recommending safety measures and changes in mooring procedures. There is no indication in this record that Dillingham even received a copy of the Coast Guard investigation report.

11/ If, as my colleagues maintain, an industrywide exemption under section 4(b)(1) existed with respect to all vessels in navigation, the Act would have been unenforceable and the Memorandum of Understanding would be a legal nullity. See also congressional discussion of diving standards in Part III-B, infra.

On November 16, 1978, the Coast Guard published "regulations governing commercial diving operations from vessels and facilities including vessels required to have a Certificate of Inspection." 43 Fed. Reg. 53678 (1978). In the preamble the Coast Guard acknowledged a conflict between the two agencies on decompression chamber requirements and stated:

> [T]he Coast Guard agrees with the general philosophy of the commentators regarding a single Federal standard for the same marine activity and has been discussing the subject with OSHA to resolve the issue.

43 Fed. Reg. at 53680.

Clearly, the Coast Guard is aware of its jurisdictional overlap with OSHA and recognizes that OSHA regulations are enforceable unless and until the Coast Guard regulations addressing the particular working conditions are effective. The Coast Guard's understanding of the application of section 4(b)(1) is consistent with the Commission's view in Puget Sound. For example, OSHA diving regulations are no longer applicable to inspected vessels and other facilities that are subject to Coast Guard diving regulations. However, they are applicable to uninspected vessels and facilities not regulated by the Coast Guard. The Coast Guard apparently views cooperation between the two agencies with statutory jurisdiction as the appropriate means of resolving conflicts. Furthermore, as is discussed in part III-B, infra, Congress has the same understanding. Under the majority's view in this case any conflict would be resolved by eliminating OSHA jurisdiction, whether or not the Coast Guard regulations are enforceable with respect to the working conditions involved.

B.

The cooperative efforts between the Coast Guard and OSHA in the development of standards for vessels and activities not highly regulated

by the Coast Guard were reported to the Commission by the Coast Guard in its amicus brief in Puget Sound, the only proceeding in which the Commission invited Coast Guard amicus participation. This interagency cooperation and the need to continue the same was noted in the House report on the Outer Continental Shelf Lands Act Amendments of 1978:

> The committee determined that special provision should be be made as to worker's safety regulation and enforcement on the OCS. Section 4(e) [33 U.S.C. § 1333(e)] of the OCS Act of 1953 provided that the Coast Guard had the responsibility for the safety of any person, which would include occupational safety on OCS facilities and in adjacent waters.
>
> The Occupational Safety and Health Act (29 U.S.C. 651) provides authority for the Secretary of Labor, through the Occupational Safety and Health Administration, to prepare interim worker's safety regulations and standards and, unless ousted by another agency or department, permanent standards, for all areas including the Shelf.
>
> The committee is aware of a continuing controversy as to whether OSHA or the Coast Guard should exercise regulatory authority over OCS worker's safety and health.
>
> Some witnesses suggested that OSHA, within the Department of Labor, be given sole responsibility, or at least lead agency authority as to worker's safety. Others opposed any agency other than Coast Guard being involved.
>
> Representatives of Coast Guard and OSHA detailed to the committee their cooperative efforts to promulgate and enforce worker's safety rules. For example, Coast Guard and OSHA have recently worked together to prepare final standards on commercial diving operations, applicable to OCS and non-OCS activities. 41 Fed. Reg. 37650-37674 (July 22, 1977). These standards were formally promulgated by the Department of Labor.
>
> As a practical matter, both OSHA and the Coast Guard will continue to function on the OCS. OSHA has prepared not only divers standards but also numerous general industry and construction standards currently in force in the OCS. OSHA and the Coast Guard have each trained diving inspectors. OSHA will maintain responsibility for health standards, even if final safety standards are promulgated by Coast Guard. OSHA administers a comprehensive health and safety law which establishes a "general duty" to maintain a safe place of work and there is no corresponding responsibility under Coast Guard enabling legislation. OSHA will always be in the position of filling in the gaps in the regulatory effort of the Coast Guard.
>
> Subsection (c)(2) intended to avoid possible interagency conflict and duplication of effort. Specifically, by overruling the "ousting language" of the Occupational Safety and Health Act, OSHA and Coast Guard are to coordinate activity to prepare and enforce regulations so as to avoid duplication and maximize employee protection. Without such a provision, duplication and conflict might occur.

> For example as to diving operations, Coast Guard could by existing law regulate safety and OSHA health; yet as a practical matter, in the field, health and safety often merge in a single operation. Similarly under existing law, Coast Guard would protect the safety of divers below the surface and OSHA protect the deck crew.
>
> The committee believed that the best way to resolve this problem is not the status quo which has led to confusion, litigation and employee resistance. Rather it is to give clear direction to the administration to develop interagency cooperative arrangements and resolve all jurisdictional conflicts. Thus, this subsection was included, not giving lead agency responsibility to OSHA, not infringing on Coast Guard jurisdiction, but providing authority for both to work together.

H. Rep. No. 590, 95th Cong., 2d Sess. 157-8 (1978), reprinted in 1978 U.S. CODE CONG. & AD. NEWS 1450, 1563-4.

The Outer Continental Shelf Lands Act of 1953 contained an internal conflict between the safety responsibilities of the Coast Guard, set forth at 33 U.S.C. § 1333(e), and that of the Department of Labor, set forth at 33 U.S.C. § 941. The statute was amended in 1958 so as to grant sole authority to the Coast Guard as to matters within the scope of 43 U.S.C. §1333(e). See Pure Oil Co. v. Snipes, 293 F.2d 60, 66-8 & n. 8-12 (1961). Subsequently, the Occupational Safety and Health Act of 1970 was enacted, assigning to the Department of Labor general authority to provide employees with safe and healthful workplaces. In its review of the background to OCS related legislation, the 1978 House report noted:

> The Department of Labor and the Department of Health, Education, and Welfare. - Both Departments have responsibilities under the Occupational Safety and Health Act of 1970. HEW makes evaluations of working conditions and provides technical assistance to employers. The Labor Department is responsible for establishing and enforcing interim and some final rules established to provide employees with a safe working environment. OSHA retains jurisdiction over issues which are not specifically regulated by the U.S. Coast Guard or U.S. Geological Survey. OSHA has no regulations which pertain solely to the OCS, but it does have a new diving standard, still subject to modification, which does directly affect operations in this area. All OSHA General Industry, Construction, and Maritime Standards have general applicability on the OCS. Currently OSHA, USGS and USCG are attempting to clarify overlapping jurisdictions and regulations.

H. Rep. No. 590, supra, at 61, reprinted in 1978 U.S. CODE CONG. & AD. NEWS at 1468.

With respect to general OCS safety responsibility and overlapping OSHA-Coast Guard authority, the House Conference Report on the Outer Continental Shelf Lands Act Amendments noted the following:

> In adopting the language providing for OCS workers' safety regulations to be promulgated by the Coast Guard, and also providing for the existing authority of the Secretary of Labor (through the Occupational Safety and Health Administration) as to workers' safety to be retained, the Conferees clearly intend neither to reduce, nor to add to existing OSHA authority, under section 466(1) [sic] of the Occupational Safety and Health Act.
>
> This section merely requires the Coast Guard to undertake expedited action where it deems it necessary to regulate hazards currently unregulated by the Government. Under its existing authority, and section 4(b)(1) of the Occupational Safety and Health Act, the Coast Guard may take any appropriate action necessary to regulate any hazard, and may over time displace the applicability of OSHA standards to other working conditions through exercise of appropriate rulemaking actions. However, the conferees intend that consultation with OSHA in standards development and administration, and opportunity for participation by interested parties in any such Coast Guard action, will assure that employees receive no less protection than under existing standards. Consistent goals contained in recent OSHA-Coast Guard agreements - maximizing the safety and health protection of employees, avoiding duplication of effort, and avoiding undue burden on the maritime industry - are also endorsed by the conferees.

H. Conf. Rep. No. 1474, 95th Cong., 2d Sess. 110, reprinted in 1978 U.S. CODE CONG. & AD. News 1674, 1709.

There is no doubt that Congress recognizes existing overlapping jurisdiction, recognizes that OSHA authority is preempted only by a Coast Guard exercise of authority over specific working conditions, and endorses the ongoing cooperative efforts of OSHA and the Coast Guard to resolve jurisdictional conflicts while providing for the safety and health of employees. It is also clear that Congress views continued OSHA jurisdiction over unregulated safety and health matters to be preferred over the type of industrywide exemption my colleagues have endorsed by their decision in this case.

IV

The administrative law judge below concluded "that the preemptive provisions of section 4(b)(1) of the Act do not apply to the instant conditions." ALJ slip op. at 15. He based his holding on his conclusion that the "Coast Guard has not promulgated and does not enforce regulations and standards governing safe working conditions for a seaman working on an uninspected tugboat." ALJ slip op. at 19. The judge's decision should be affirmed.

UNITED STATES OF AMERICA

OCCUPATIONAL SAFETY AND HEALTH REVIEW COMMISSION

| | |
|---|---|
| SECRETARY OF LABOR,<br>Complainant,<br>v.<br>DILLINGHAM TUG & BARGE CORPORATION,<br>Respondent. | **DECISION AND ORDER**<br>OSHRC DOCKET NO. 77-4143 |

Appearances:

Alan Raznick, Esquire, San Francisco, California for Complainant.

John R. Lacy, Esquire, Honolulu, Hawaii for Respondent.

JERRY W. MITCHELL, Judge

This proceeding involves the following issues:

1. Whether the Secretary of Labor (the Secretary) has jurisdiction under the Occupational Safety and Health Act of 1970 (the Act) over crew members on an uninspected towboat;
2. Whether the Secretary's jurisdiction over towboat activities of Dillingham Tug & Barge Corporation (Dillingham) is preempted in favor of the Coast Guard by reason of the provisions of Section 4(b)(1) [29 U.S. C. §653(b)(1)] of the Act;
3. Whether Dillingham's plea of Nolo Contendere should be accepted with respect to the citation at issue here;

4. Whether Dillingham violated the General Duty Clause [Section 654(a)(1)] of the Act on 3 July 1977 when a Dillingham seaman on a towboat was permitted to jump from a towboat to the top of a mooring buoy, and vice versa; and

5. The amount of penalty, if any, to be assessed in connection with any proven violation.

Issues 1 and 4 are answered in the affirmative, Issues 2 and 3 are answered in the negative, and a penalty of $245 is Assessed.

## STATEMENT OF THE CASE

This is a proceeding before the Occupational Safety and Health Review Commission (the Commission) pursuant to Section 659 of the Act in which Dillingham is contesting a citation, including the proposed penalty and abatement date, issued to Dillingham by the Secretary. Trial was held at Honolulu, Hawaii on 18 April 1978.

## FINDINGS OF FACT

1. On 3 July and 28 September 1977 and at all times material hereto, Dillingham Tug & Barge Corporation (Dillingham) was an Hawaiian corporation engaged in providing maritime towboat services to vessels navigating Hawaiian waters from interstate, intrastate, and foreign ports. During the year preceding

3 July 1977, Dillingham had gross revenues in excess of one million dollars. During calendar year 1977, Dillingham had a daily average of 188 employees and provided the only towboat service available in the state of Hawaii. (File, Answer; Dillingham's Responses to the Secretary's Interrogatories and Requests for Admissions; and Stipulated Agreed Facts.)

2. On 3 July 1977 Dillingham owned and operated the towboat (tug) MAPU, a steel hulled, oil screw, towing vessel 47.1 feet in length, of 33 Gross and 23 Net tons. Prior to and on 3 July 1977, MAPU was not licensed by the U.S. Coast Guard, nor was she inspected or required to be inspected by the U.S. Coast Guard. Although not required to be inspected by the Coast Guard MAPU was required, while underway, to be under the actual direction and control of a person licensed by the Coast Guard to operate her in that particular geographic setting. (Dillingham's Responses to the Secretary's Requests for Admission; Merchant Vessels of the United States, U.S. Coast Guard Publication #408, 1973 Edition; 46 U.S.C. §§361, 405(b)(1)(D), and 405(b)(2); 46 CFR 24.05-1; and Report of Coast Guard Investigation.)

3. On the morning of 3 July 1977 the tanker M/V AEGEAN ISLAND was arriving at the Hawaiian Independent Refinery, Inc. Anchorage (HIRI Anchorage) from the foreign port of Brunei with a cargo of crude oil. (Stipulated Agreed Facts.)

4. The HIRI Anchorage, an open roadstead with a number of mooring buoys for securing large tankers, was located about

two miles off-shore from Barbers Point, Oahu, Hawaii. (Stipulated Agreed Facts; and Report of Coast Guard Investigation.)

5. On 3 July 1977, Francis Michael Kane was certified as a merchant seaman. He had previously been issued "Z" card (Merchant Mariner's Document) number Z-1297359 which carried an endorsement as "Ordinary Seaman" and was currently valid on that date. Kane was a member of the Inland Boatmen's Union of the Pacific, a maritime union, and had been employed by Dillingham for nine years as an Ordinary Seaman. During those nine years he had been assigned at various times to work on all of Dillingham's towboats.

Kane was aboard MAPU as a deckhand when she departed from Honolulu at about 0800 on 3 July, assigned to assist in mooring M/V AEGEAN ISLAND in the HIRI Anchorage. Kane's regularly assigned duties as a deckhand aboard MAPU included the stowing of lines, operation and inspection of equipment aboard the towboat and responding to orders given by the towboat operator. The duties of a deckhand during a mooring operation such as that involving M/V AEGEAN ISLAND on 3 July include, but are not limited to, securing mooring lines from the tanker being assisted to the mooring buoys so as to secure the tanker in the anchorage.

(Affidavit of Joseph Keane; Dillingham's Responses to the Secretary's Requests for Admissions; Dillingham's Responses to the Secretary's Interrogatories; and Stipulated Agreed Facts.)

6. Mooring of the tanker M/V AEGEAN ISLAND in the HIRI Anchorage began at about 1115 on the morning of 3 July and was completed a little more than two hours later. The Dillingham towboats MAPU and MA'A were assigned as mooring boats to run mooring lines from the tanker to the buoys. The bow and stern lines were run out and secured without incident. The mooring wire for Buoy No. 4 was then taken on the deck of MA'A and pulled towards the buoy, but MA'A could not quite reach the buoy because the wire was too short. MAPU came to her assistance by pushing Buoy No. 4 towards MA'A and by Kane going from MAPU to the top of the buoy to assist MA'A's deckhands in securing the wire on the buoy. After this task was successfully completed, MA'A returned to the tanker to pick up the wire for Buoy No. 3 and MAPU went alongside Buoy No. 4 and picked up Kane.

MAPU then proceeded to Buoy No. 3, which was located on the windward side of M/V AEGEAN ISLAND, to assist MA'A as necessary. MA'A took some of the mooring wire on deck and proceeded towards Buoy No. 3. Even though all available wire was run out from the tanker, MA'A was unable to reach the buoy because of the shortness of the wire. MAPU again assisted by pushing Buoy No. 3 to MA'A and Kane boarded the buoy to assist MA'A's deckhands in placing the wire on the buoy's mooring hook. When this was accomplished, MA'A departed for the tanker and MAPU started backing down to the buoy to pick up Kane. Kane, who was standing at the edge of the buoy in readiness to jump to

MAPU, apparently lost his balance and fell from the top of the buoy. During the fall, he caught himself on a lifting pad at the edge of the buoy. At this time the stern of MAPU was no more than six feet from the buoy. The astern motion of MAPU, with her engines in neutral, carried her to the buoy and crushed Kane between her stern and the buoy. Even though the other deckhand instantly went to Kane's aid, Kane was crushed twice more before he could be lifted aboard MAPU or the tow-boat could clear the buoy on full ahead engines. Medical assistance was immediately requested, but Kane was deceased by the time such help was reached.

(Stipulated Agreed Facts; and Report of Coast Guard Investigation.)

7. At the time of Kane's injury, the weather was partly cloudy skies with winds of 15 to 25 knots (17 to 29 miles per hour) from the East-North-East and good visibility. The water was rough with 3 to 5 foot choppy seas from the North-East and 6 to 9 foot swells from the North-East. Small craft warnings were in effect. (Report of Coast Guard Investigation.)

8. Because Kane's death occurred as part of a marine casualty involving loss of life, an officer from the U.S. Coast Guard Marine Safety Office in Honolulu informally investigated the accident pursuant to the authority set forth in 46 U.S.C. §239(a). The report of that investigation, which was completed on 2 February 1978, was given final approval by the Commandant

of the Coast Guard on 28 February 1978. (Report of the Coast Guard Investigation.)

9. The Coast Guard did not conduct a "formal" investigation of the 3 July 1977 accident involving Kane. (Tr. pgs 20-21.)

10. The Coast Guard did not, during or following the informal investigation, take any action against or with respect to Dillingham. The corrective action suggested by the Coast Guard was directed to the operators of the HIRI Anchorage in a special meeting which did not involve or include any Dillingham representative. At that special meeting, the Coast Guard reccommended to the operators of the HIRI Anchorage that certain modifications of the buoys be made so as to provide safer working conditions on the buoys. (See Report of Coast Guard Investigation, ltr from Moreau to Pacific Resources, Inc. and 18 July 1977 Johnson memorandum to the File.)

11. The Coast Guard treated the comments and recommendations of the operator of MAPU as an account of the mooring and, therefore, considered that they were not safety measures. (See Item 19 on page 4 of the Report of the Coast Guard Investigation.)

12. The Coast Guard did not exercise any enforcement authority with respect to the 3 July accident involving Kane. (Tr. pg 21.)

13. Regulations promulgated by the Coast Guard with respect to seamen are directed towards setting qualifications

standards which an individual must meet in order to be issued and hold a seaman's document. The Coast Guard has not promulgated regulations or standards governing the safety of a seaman while working or how he does his work. Nor has the Coast Guard promulgated any general or specific regulations or standards with respect to a seaman going from a towboat to a buoy or vice versa. (Tr. pgs 12-13, 15-18, 23-36, and 28.)

14. The regulation set forth in 33 CFR 110.236 controls and refers to the safety of vessels and facilities in the HIRI Anchorage, the risk of oil pollution, and the fouling of submerged pipe lines. Nothing in the section refers to or provides for, employment safety. (33 CFR 110.236.)

15. On 28 September 1977, a representative of the Secretary of Labor investigated Kane's fatal accident. Following that inspection, Citation No. 1 was issued to Dillingham on 16 November 1977. Citation No. 1 alleged a Serious violation of Section 5(a)(1) (the General Duty Clause) of the Act and proposed a penalty of $490. Dillingham contested the citation, proposed penalty, and abatement date in a timely manner by letter dated 1 December 1977. (File.)

## LAW AND OPINION

SECRETARY'S MOTION TO STRIKE DOCUMENTS --

The Secretary has filed a motion to strike the following two documents which were attached to Dillingham's "Memorandum

of Points and Authorities in Support of Motion to Dismiss for Lack of Jurisdiction and Acceptance of Plea of Nolo Contendere" when that document was filed on 18 May 1978:

1. "Affidavit of Lieutenant Commander James F. VanVranken" - This affidavit was not discussed or mentioned at any time during the trial or off the record discussions that occurred on the day of trial. Dillingham did not request opportunity to offer such a document, nor reserve any general right to offer further evidence following the closing of the record at the conclusion of the trial on 18 April 1978.

The parties were clearly advised on the record during that trial that it was their responsibility to offer, and have included in the record, everything they wanted considered in making the decision. See the following comments from the trial transcript.

> "Everything said during the hearing will be recorded verbatim unless I direct otherwise. I'll only direct that we go off the record if one of you moves for it and it becomes apparent that we need to. And the reason for this is that the decision will be made based upon the record, and I want everything said recorded." (Tr. pgs 3-4.)
>
> * * * *
>
> "At the same time you want to think about it and be sure you get in everything that you wish me to consider. I've only re-opened one out of 150 cases to permit additional evidence. So ordinarily it would not come in; if you don't get it today, you've had it." (Tr. pgs 4-5.)

In view of this warning during the trial and because of the failure of Dillingham to mention the affidavit during the trial or reserve the right to offer additional evidence at a later date, the affidavit is STRICKEN and DISREGARDED.

An additional reason for striking the affidavit is that offering the document after the trial completely precludes the testing of the veracity of the evidence contained in the affidavit through the medium of cross-examination. This facet becomes very important when the affidavit is compared with the testimony given by Captain Ewels during the trial. He was VanVranken's superior officer in the chain of command. His testimony was tested and clarified through cross-examination so that it became clear and definite. There is a direct conflict between Captain Ewels' testimony given under oath while subject to full cross-examination, and the information contained in the affidavit. Captain Ewels' testimony clearly disagress with the contents of the affidavit in that his testimony is that there are no Coast Guard regulations governing working conditions on mooring buoys or of towboat seamen. On the other hand, the affidavit is worded in rather broad general terms which do not specifically establish the existence of any Coast Guard jurisdiction over Dillingham's working conditions or of any Coast Guard regulation of mooring operations involving towboat crewmembers working on or in conjunction with mooring buoys. Consequently, even if the affidavit was found to be admissible, it would not add any cognizable proof to this proceeding.

2. "M/V MAPU--Investigation into the death of Francis Michael Kane on 3 July 1977"-

The first three pages of this document were attached to and submitted with Dillingham's "Memorandum of Points and

Authorities in Support of Motion to Dismiss" filed on 7 April 1978. During off the record discussions at the beginning of the trial on 18 April, the undersigned Judge requested that a full copy of the document be furnished for the record. At that time Dillingham undertook to do so. There was no objection from the Secretary. Because of that request and the lack of an objection from the Secretary, the entire investigation report and its attachments are ADMITTED in evidence.

The Secretary's objections based upon Rule 12(f) of the Federal Rules of Civil Procedure are without merit because the proffered documents are not part of any pleadings and, thus, are not covered by that Rule.

DILLINGHAM'S MOTION TO DISMISS --

Shortly before the trial in this matter, Dillingham filed a "Memorandum of Points and Authorities in Support of Motion to Dismiss" but did not file the actual Motion at that time, nor at any subsequent time. However, in spite of this oversight, all of the participants obviously understand the grounds and purpose of the motion. The motion was a major subject of discussion and argument at the time of the trial and has been renewed and vigorously argued in the post-trial briefs. The thrust of the argument supporting the motion is two-fold:

1. That the Occupational Safety and Health Act of 1970 (the Act) and the standards and regulations promul-

gated thereunder are not applicable to vessels or to seamen working on vessels; and/or

2. That under the provisions of Section 4(b)(1) of the Act [29 U.S.C. §653(b)(1)] the Coast Guard has pre-empted OSHA jurisdiction over vessels and seamen generally.

1. Applicability of the Act to seamen --

Dillingham insists that this first theory should be treated as a threshhold issue which, when properly resolved, will dispose of the entire case without need to consider the second point of its argument. In short, Dillingham urges that since the circumstances at issue here involve a seaman working on a towboat, exclusion from coverage under the Act is automatic. Dillingham argues that this exclusion occurs solely because the deceased Dillingham employee was a seaman working on a towboat and, thus, was not covered by the Act.

Dillingham bases this argument on the fact that seamen are entitled to the benefits of the Jones Act and, that as a consequence of that coverage, together with the alleged Coast Guard responsibility for regulating the safety of a seaman's working conditions, seamen are automatically excepted from the coverage of OSHA. This Dillingham argument is in direct contravention of the purpose and policy enunciated by Congress and set forth in Section 2(b) of the Act [29 U.S.C. §651(b)], i.e.,

> "...to assure so far as possible every working man and woman in the Nation safe and healthful working conditions..."

Applying Dillingham's theory to the situation here would, in the absence of Coast Guard regulation (see discussion below and Findings 12, 13, and 14), deny Dillingham's employees protection in their work environment.

The Jones Act, which is concerned with the private rights of an injured seaman with respect to his employer, does not provide protection equivalent to, or even approaching, that which accrues to employees through OSHA workplace safety and health standards. OSHA safety standards are applicable to the work environment at all times and without regard to the actual occurrence of an injury. On the other hand, the Jones Act only gives the seaman a cause of action for redress from his employer after he has been injured. This Jones Act right does nothing towards improving the safety of working conditions in the work place.

The foregoing discussion leads to the conclusion that Dillingham's argument is fallacious. The fact that the deceased employee was a seaman and that the workplace in question was a morring operation involving a towboat and buoy, taken alone, does not automatically exclude OSHA coverage.

The second portion of this Dillingham threshhold theory which asserts that the Coast Guard has responsibility for a seaman's safe working conditions is also without merit. The evidence in this record clearly shows that the Coast Guard does not have, or exercise, any direct authority over the working conditions of seamen on towboats. See discussion of this topic below in the portion of this decision dealing with the Section

4(b)(1) argument. The threshhold issue raised by Dillingham is, thus, without any merit. It must, and does, FAIL.

2. Section 4(b)(1) preemption --

This section of the Act provides that, "Nothing in this Act shall apply to working conditions of employees with respect to which other Federal agencies, ..., exercise statutory authority to prescribe or enforce standards or regulations affecting occupational safety and health."

The Review Commission and the courts have uniformly held that this section of the Act does not provide an industry wide exception. At the same time these decisions have required that the other federal agency must actually be exercising a power to regulate safety conditions in order to preempt OSHA. Southern Pacific Transportation Co., 74 OSAHRC 83/A2, 2 OSHC 1313 (BNA) 1974-75 OSHD 19,054 (CCH) (Docket No. 1348); Marshall v. Northwest Orient Airlines, Inc., 574 F.2d 119, 122 (2nd Cir. 1978); Southern Pacific Transportation Co. v. Usery, 539 F.2d 386 (5th Cir. 1976); Southern Railway Company v. OSHRC,539 F.2d 335 (4th Cir. 1976); and Baltimore and Ohio Railroad Company v. OSHRC, 548 F.2d 1052 (D.C. Cir. 1976).

Dillingham urges that Section 4(b)(1) of the Act [29 U.S.C. §653(b)(1)] preempts OSHA in favor of Coast Guard jurisdiction. In order for such preemption to come into effect in this instance, Dillingham must show that the Coast Guard has authority for promulgating such work safety standards and, further, that

the Coast Guard has actually exercised that authority by promulgating and enforcing such safety standards.

As noted earlier, the evidence in this record does not support Dillingham's argument. In fact, the evidence is exactly to the contrary. The senior Coast Guard witness, Captain Ewels, clearly testified that the Coast Guard has not promulgated any regulations or standards governing the safety of a seaman while working, or the conditions and methods existing in the work environment. He also testified that the Coast Guard has not promulgated any general or specific standards or regulations with respect to a seaman going from a towboat to a mooring buoy, or vice versa. Further, he specifically testified that the Coast Guard did not exercise any enforcement authority with respect to the accident on 3 July 1977 which resulted in the death of the Dillingham employee.

An additional crucial aspect of this particular set of circumstances is the fact that MAPU was an uninspected towboat which was not licensed by the Coast Guard and was not required to be inspected by the Coast Guard. In short, she was not under the jurisdiction of the Coast Guard.

The evidence in this record, thus, fully supports a holding that the preemption provisions of Section 4(b)(1) of the Act do not apply to the instant circumstances. It is concluded here that OSHA had jurisdiction over the work conditions and situation existing aboard MAPU and on the mooring buoy on 3 July 1977.

DILLINGHAM'S PLEA OF NOLO CONTENDERE --

During the trial, and in briefs filed following the trial, Dillingham has sought to enter a plea of "Nolo Contendere" to the citation if, and only if, jurisdiction is found to exist under the Act. Dillingham's contention seems to be that the filing of such a plea would assist it in avoiding possible liability to survivors of the deceased seaman.

The definition of "Nolo Contendere" set forth in the Revised Fourth Edition of Black's Law Dictionary reads, "Nolo Contendere. Lat. I will not contest it. The name of a plea in a criminal action, having the same legal effect as a plea of guilty, so far as regards all proceedings on the indictment, and on which the defendant may be sentenced." (Emphasis added.) Black's Law Dictionary 1198 (Revised 4th Ed. 1968).

Research of this issue has failed to reveal a single instance where such a plea has been accepted in a civil case. All of the cases and writings on this subject are in connection with criminal proceedings. There are no cases, or suggestions from legal scholars, that the plea of "Nolo Contendere" is applicable to a civil case. This aspect of the plea is stressed here because these proceedings are not, in any sense of the word, criminal in nature.

As Dillingham concedes, the acceptance of a plea of "Nolo Contendere" is within the sole discretion of the Court. (Dillingham's Memo of Points and Authorities filed on 18 May

at pg 15; "Plea of Nolo Contendere" at 89 A.L.R.2d 540.) Accordingly, since there is discretion in the Court as to whether to accept the plea and because the plea is only recognized in criminal proceedings, Dillingham's tender of the plea of "Nolo Contendere" is rejected in these proceedings which are totally civil in nature.

DILLINGHAM'S MOTION TO STRIKE THE SECRETARY'S PROPOSED CONCLUSIONS OF LAW 5 AND 6 and ORDER --

Dillingham moves to strike these proposals on the grounds that they do not conform to the Settlement Agreement signed by the parties on 20 April, two days after the trial, to become effective if the finding here should be that Dillingham is subject to OSHA jurisdiction.

Proposals filed by the parties following a trial are for the sole purpose of assisting the trier of fact in formulating the findings, conclusions, and Order to be entered in the matter. They may be used or discarded by the Judge and are not binding upon him. In this case, as in others, the proposals of the parties have been thoroughly considered in arriving at those entered here. Any proposals that are not included, in whole or in part, in the findings, conclusions, and Order entered here, are deemed to have been rejected. Dillingham's motion to strike is, thus, denied with respect to any objected to portion of the Secretary's proposed conclusions of Law and Order which appear in this Decision and Order.

THE SETTLEMENT AGREEMENT --

Following the trial, the parties entered into a Settlement Agreement which was to take effect only if the finding in this proceeding was that Dillingham is subject to jurisdiction under the Act. Since that eventuality has occurred, it is now necessary to determine the effect of the concessions made by the parties in reaching that agreement so as to avoid further costs of litigation.

In the Settlement Agreement the parties agree to a reduction of the proposed penalty from $490 to $245. They also agree to the entry of an Order making the citation and amended penalty a final Order of the Occupational Safety and Health Review Commission. At the same time, Dillingham stipulates that the violation alleged in Serious Citation No. 1 has been abated in that Dillingham has taken affirmative steps by ordering its employees to stay off the buoys. Each of these concessions appear to be reasonable in nature and consistent with the positions of the parties.

The foregoing Findings of Fact and discussion of the law and evidence, as well as the contents of the Settlement Agreement executed by the parties, support the following:

## CONCLUSIONS OF LAW

1. At all times material hereto, Dillingham Tug & Barge Corporation, was an employer engaged in furnishing the only

towboat services available in the state of Hawaii in a business affecting commerce within the meaning of Section 652 of the Occupational Safety and Health Act of 1970. On 5 December 1977, Dillingham filed a letter contesting the citation and proposed penalty involved here. Dillingham thereby brought itself and the subject matter of these proceedings within the jurisdiction of the Occupational Safety and Health Review Commission pursuant to Section 659 of the Act.

2. The affidavit of Lieutenant Commander James F. Van-Vranken is not admissible because it was not offered before the trial record was closed.

3. The complete report of the Coast Guard Investigation into the death of Francis Michael Kane, requested by this Judge during the trial and not objected to by the Secretary at that time, is admissible in evidence.

4. Working conditions involving seamen working on an uninspected towboat are not automatically excluded from the coverage of the Occupational Safety and Health Act of 1970 simply because seamen are involved.

5. The Coast Guard has not promulgated and does not enforce regulations and standards governing safe working conditions for a seaman working on an uninspected towboat.

6. The Dillingham workplace and working conditions involving the towboat MAPU and the mooring buoys to which the vessel M/V AEGEAN ISLAND was being moored on 3 July 1977 are

subject to the provisions of the Occupational Safety and Health Act of 1970.

7. A plea of "Nolo Contendere", which is only applicable to criminal proceedings, is not acceptable in these civil proceedings.

8. Since the agreed condition precedent to entry of the Settlement Agreement signed by the parties to this proceeding is affirmatively found herein to exist, the remaining issues of the case will be disposed of in accordance with the agreement of the parties as set forth in that Settlement Agreement.

## ORDER

Based upon the foregoing Findings of Fact, Conclusions of Law, and for good cause shown, it is

ORDERED that:

1. The Settlement Agreement be, and hereby is, APPROVED; and
2. Citation No. 1 and the amended proposed penalty of $245 be, and hereby are, AFFIRMED.

Jerry W. Mitchell

# NOTICE OF DECISION

**SECRETARY v. V.I.P. DEVELOPMENT, INC.**

**OSHRC Docket No. 80-7113**

1. Enclosed is a copy of my decision. It will be filed with the Commission on June 29, 1982, and will become the final order of the Commission on July 29, 1982, unless a Member of the Commission directs that it be reviewed.

2. You may petition for discretionary review of this decision by the Commission. A petition may be filed directly with me within twenty (20) days from the mailing of my decision. Thereafter, a petition should be mailed to the Executive Secretary, Attention:

   Chief Review Counsel
   Occupational Safety and Health Review Commission
   1825 K Street, N. W., Suite 601
   Washington, D. C. 20006

   Any petition filed directly with the Commission will be considered to the extent that time and resources permit. The last day the Commission may consider your petition is July 29, 1982. This final order date is fixed by law and cannot be extended under any circumstances.

3. If review is ordered by a Member of the Commission, each party to this case will be notified. In addition, each party will be given an opportunity to submit a brief to the Commission.

4. Please complete the enclosed postcard indicating whether you presently intend to seek review of this decision and mail the completed card promptly. Your response does not bind you in any way, but it assists the Commission in processing your petition when it is filed.

5. For any further details on the review process, see Commission Rules 90, 91, 92, and 93.

APPEARANCES:

Patrick M. Zohn, Esquire, Office of the Solicitor, U. S. Department of Labor, Cleveland, Ohio, on behalf of complainant

Roger L. Sabo, Esquire, Columbus, Ohio, on behalf of respondent

## DECISION AND ORDER

SALYERS, Judge: This matter arises under the provisions of the Occupational Safety and Health Act (29 U.S.C. § 651, et seq.). The respondent, V.I.P. Development, Inc., has been charged by the Secretary of Labor with several violations of the Act and the standards promulgated thereunder, including willful and serious violations. The parties have resolved all violations with the exception of the three that comprise the subject matter of this decision.[1/]

---

1/ The parties have prepared and signed a partial stipulation and settlement agreement disposing of all other matters. This document is in the record as Exhibit J-21 and is hereby incorporated in this decision.

The case was tried before Judge Jess D. Ewing in Cincinnati, Ohio. Before Judge Ewing could render a decision in this case, he transferred to another agency and this case was reassigned to the undersigned Administrative Law Judge by order of the Commission dated February 8, 1982. The undersigned will decide this case based upon the record as presently constituted.[2/]

The respondent, V.I.P. Development, Inc., is a construction contractor engaged in the business of sewer line, water line and street construction for residential subdivisions, condominium development and commercial building sites. At the time of the Secretary's investigation, respondent was engaged in constructing sewer line excavations in Butler County, Ohio, at the Woodland Hills development site Job #204. The inspection was prompted by an accident that occurred near the excavation known as Manhole #4.

On the afternoon of October 9, 1980, William J. Wilkerson, an industrial hygienist with the Cincinnati OSHA office, and his supervisor arrived at the Woodland Hills project and conferred with Mr. Robert Broshear, the company foreman and job superintendent (Tr. 16). Mr. Wilkerson advised Mr. Broshear that he was there as a result of a complaint received by his office that on the previous day an accident had occurred involving injuries to two employees (Tr. 18). That complaint dealt with exposure to electrical power lines. Mr. Broshear alleges that he was led to believe the investigation would relate solely to the accident (Tr. 150). Mr. Wilkerson admits such a statement was made to Mr. Broshear but that he

---

2/ After reassignment of this case, the undersigned afforded the parties the alternatives of (1) retrying the case ab initio, (2) having a supplimentary hearing to take testimony in those areas where credibility was a factor, or (3) deciding the case on the constituted record (See Ex. J-23). Complainant preferred the latter choice and respondent, while not agreeing to any of the proposed alternatives, did not choose to "engage in further litigation" (Ex. J-24).

qualified the statement by informing Mr. Broshear he would inspect anything else in "plain view" if it appeared "to be a serious hazard" (Tr. 76, 129).

Since the citations remaining for decision are unrelated to the electrical accident, the respondent urges its Fourth Amendment rights have been violated and that all the evidence in this case should be suppressed, citing Sarasota Concrete Co., 81 OSAHRC 9 BNA OSHC 1608, 1981 CCH OSHD ¶ 25,360 (No. 78-5264, 1981), and Marshall v. Barlow's, Inc., 436 U. S. 307 (1978).

Respondent's argument that the Secretary exceeded his authority in citing matters during the course of the inspection not related to the specific complaint is without merit. In Barlow's, Inc., supra, the Supreme Court ruled that to the extent that the Act allowed warrantless nonconsential inspections, the Act violated the Fourth Amendment rights of those so inspected. Both Barlow's, Inc., supra, and Sarasota Concrete Co., supra, present situations where an employer had refused entry to the Secretary for purposes of inspecting the employer's private property. While the Fourth Amendment guarantees the right to privacy, that right can only exist where there is reasonable expectation of privacy. Nothing in this record reflects that the respondent's work site was walled in or cordoned off from the public nor is there any showing that respondent made any attempt to assert the right of privacy at the time of the inspection. On the contrary, the inspection was made with respondent's consent and with respondent's understanding that serious hazards would not be ignored if they were in plain view. The inspector has cited only those matters which were in plain view. See Environmental Utilities Corporation, 77 OSAHRC 40/A2, 5 BNA OSHC 1195, 1977-78 CCH OSHD ¶ 21,709 (No. 5324); Laclede Gas Company, 79 OSAHRC 94/E13, 7 BNA OSHC 1875, 1979 CCH OSHD ¶ 24,007 (No. 76-3241); Accu-Namics, 515 F.2d 828 (5th Cir. 1975); and

Ackermann Enterprises, Inc., _____ OSAHRC _____, _____ BNA OSHC _____, _____ CCH OSHD _____ (No. 80-4971).

The issues remaining to be determined in this case are as follows:

1. Did the respondent seriously violate the provisions of 29 C.F.R. § 1926.602(a)(9)(ii)[3/] by (a) operating a Caterpillar 977L loader in reverse gear without having an audible alarm in operable condition and (b) operating a Bucyrus Erie 350 excavator in reverse with no audible signal?

2. Did respondent willfully violate the provisions of 29 C.F.R. § 1926.651(c)[4/] by exposing employees to moving ground in an excavation which was not shored or sloped as required by the standard?

3. If violations have occurred, what penalty is appropriate?

Alleged Violation of 29 C.F.R. § 1926.602(a)(9)(ii)

The evidence is uncontradicted that during the course of his investigation, Mr. Wilkerson observed a Caterpillar 977L loader in use by one of respondent's employees for transporting piping in connection with the construction operation moving in reverse gear. While this loader was equipped with a reverse signal alarm,

---

3/ 29 C.F.R. § 1926.602(a)(9)(ii) provides:

> (ii) No employer shall permit earthmoving or compacting equipment which has an obstructed view to the rear to be used in reverse gear unless the equipment has in operation a reverse signal alarm distinguishable from the surrounding noise level or an employee signals that it is safe to do so.

4/ 29 C.F.R. § 1926.651(c) states:

> (c) The walls and faces of all excavations in which employees are exposed to danger from moving ground shall be guarded by a shoring system, sloping of the ground, or some other equivalent means.

more commonly referred to as a backup alarm, the alarm system was inoperable at the time Mr. Wilkerson observed this instance (Tr. 27). It is also undisputed that the machine in question is a bidirectional machine within the meaning of the standard. It is further uncontradicted in the record that the operator of this loader has a clear and unobstructed view to the rear and, in all instances, when operating in reverse, will look to the rear while moving (Tr. 89, 144, 158-159, 196, 213; Exs. R-1, R-2, R-3). Since the Government has failed to prove an essential element of the standard; i.e., the earthmoving equipment in question which "has an obstructed view to the rear," this citation must be vacated.

The Secretary advances the argument that, while this piece of equipment did not have an obstructed view to the rear, "the operator's view is obstructed by operation" (Tr. 90). The Secretary makes a plausible argument that obstruction by operation means that the operator of a loader, while working the controls which are all located in front of him, may not be able to devote his full attention to the area to his rear when operating in a reverse direction. Thus, an audible backup alarm is needed not just for those times when there are physical obstructions to the rear, but also those times when the operator is distracted from devoting his full attention to the rear when backing up. This is the dual rationale requiring the use of backup alarms. They are to warn people behind the equipment that it is operating in a reverse direction (Secretary's Brief, p. 12). Under this theory, all bidirectional earthmoving equipment would be required to have backup alarms. It may well be that this requirement would be in the best interest of safety, but this is not what the Secretary has recited in the standard. If it were the Secretary's intention to require all bidirectional earthmoving equipment to have backup alarms, the standard should so reflect that intention by deleting the qualifying language.

Regulations cannot be construed to mean what an agency intended but did not adequately express. Kent Nowlin Construction Co. v. O.S.H.R.C., 593 F.2d 368 (10th Cir. 1977); Diamond Roofing Co. v. O.S.H.R.C., 528 F.2d 645 (5th Cir. 1976).

I also find that the Secretary has failed to establish respondent violated the cited standard in the case of the Bucyrus Erie 350 excavator. This machine is as depicted in Secretary's Exhibit C-2. The operator's cabin and the operational components are mounted on treads or tracks and the equipment has a 360-degree swing radius (Tr. 155). When in operation, the operator can and does swing the cabin around and face the direction in which he is moving (Tr. 35, 156). There is some question in the record that this machine ever moves in a reverse direction (Tr. 155, 197). The common and usual practice is for the operator to rotate the cabin in the direction that the machine moves (Tr. 155, 198, 214). Because of this machine's unique capacity to swivel the operator's cabin, and the fact that the operator swivels the operator's cabin to face the direction in which the machine moves, it appears this is not a bidirectional machine as contemplated by the standard. This conclusion is further bolstered by the fact that excavators are not listed in the standard itself as the type of machine to which the cited standard applies. Indeed, even Mr. Wilkerson seems to concede at one point in the transcript that a backup alarm would not be necessary on an excavator except in unusual circumstances (Tr. 40-41). The United States Court of Appeals for the Second Circuit under similar facts found that a scraper, which performed its function primarily in a forward gear, was not subject to the standard. S. J. Groves & Sons v. O.S.H.R.C., 648 F.2d 95 (2nd Cir. 1981). Accordingly, the citation, as it relates to the excavator, will be vacated.

## Alleged Violation of 29 C.F.R. § 1926.651(c)

During the course of his inspection, Mr. Wilkerson observed an excavation referred to in the record as Manhole #4. His inspection of the manhole revealed that the excavation was being dug in what he considered to be average soil (Tr. 49). The south, east and west walls of the manhole were vertical to the base of the excavation and were neither sloped nor shored (Tr. 52, 56). Mr. Wilkerson took measurements of the excavation which revealed that the manhole was 9 feet deep,[5/] 9 feet wide, and 15 to 15 1/2 feet long (Tr. 45). He then determined by interviewing employees that laborers had worked in the hole on the previous day. Due to the composition of the soil and the fact that the sides of the excavation were neither shored nor sloped, Mr. Wilkerson determined that respondent had willfully violated the provisions of 29 C.F.R. § 1926.651(c).

The respondent first argues that the Secretary has charged respondent under the wrong standard. Respondent urges that the Secretary should have cited 29 C.F.R. § 1926.652(a),[6/] the trenching standard, rather than § 1926.651(c), the standard dealing with excavations. Both terms are defined at 29 C.F.R. § 1926.653 as follows:

---

5/ Respondent and its witnesses attempted to show that the depth was seven feet but took no actual measurements. Since Mr. Wilkerson actually measured the depth, his version will be accepted.

6/ 29 C.F.R. § 1926.652(a) provides as follows:

> (a) Banks more than 5 feet high shall be shored, laid back to a stable slope, or some other equivalent means of protection shall be provided where employees may be exposed to moving ground or cave-ins. Refer to Table P-1 as a guide in sloping of banks. Trenches less than 5 feet in depth shall also be effectively protected when examination of the ground indicates hazardous ground movement may be expected.

(f) "Excavation"—Any manmade cavity or depression in the earth's surface, including its sides, walls, or faces, formed by earth removal and producing unsupported earth conditions by reasons of the excavation. If installed forms or similar structures reduce the depth-to-width relationship, an excavation may become a trench.

* * *

(n) "Trench"—A narrow excavation made below the surface of the ground. In general, the depth is greater than the width, but the width of a trench is not greater than 15 feet.

The definition of "excavation" is sufficiently broad to include all "trenches." Since the excavation in question does not satisfy the depth-to-width test to qualify as a trench; i.e., depth the same as and not greater than the width, the Secretary has applied the proper standard.

Respondent further urges that the excavation standard is so vague and imprecise that it fails to advise an employer what is required for compliance citing Lloyd C. Lockrem, Inc. v. O.S.H.R.C., 609 F.2d 940 (9th Cir. 1979), Kent Nowlin Construction Co., Inc. v. O.S.H.R.C., 593 F.2d 368 (10th Cir. 1977), and other cases. This argument has long since been laid to rest by the Review Commission. In a consistent line of cases commencing with D. Federico Co., Inc., 76 OSAHRC 13/A2, 3 BNA OSHC 1970, 1975-76 CCH OSHD ¶ 20,422 (No. 9879), aff'd on other grounds, 558 F.2d 614 (1st Cir. 1977), the Commission has upheld the validity of the excavation standard. See also Connecticut Natural Gas Corp., 78 OSAHRC 60/B3, 6 BNA OSHC 1796, 1978 CCH OSHD ¶ 22,874 (No. 13964); Terra Motus Co., Inc., 77 OSAHRC 152/B1, 5 BNA OSHC 1696, 1977-78 CCH OSHD ¶ 22,040 (No. 14154); and M. J. Lee Construction Co., 79 OSAHRC 12/A2, 7 BNA OSHC 1140, 1979 CCH OSHD ¶ 23,330 (No. 15094). Where Commission precedent is clear and consistent, the undersigned is bound to follow the precedent.

Respondent advances a powerful argument that the Secretary has experienced a failure of proof in regard to this citation. This standard specifically requires that

there be a showing employees are exposed to the hazard of "moving ground." This argument is three-pronged: (1) Mr. Wilkerson, the Secretary's inspector, did not have the training or experience to render an expert opinion on the question of soil composition; (2) the Secretary conducted no test of the soil to determine its composition nor did the Secretary present any evidence to show unusual circumstances existed in the area which might cause the ground to move;[7/] and (3) the testimony of respondent's employees and its expert clearly establishes that the walls of the excavation were stable and not subject to collapse. After careful consideration of all the evidence in this case, I must concur with the respondent.

Mr. Wilkerson is an industrial hygienist employed by the Occupational Safety and Health Administration. He has a degree in chemistry and would ordinarily never make an inspection of a construction site.[8/] He did not make any scientific tests of the soil at the site and readily admits that he has neither the expertise nor the training to make such tests.[9/] In fact, Mr. Wilkerson had never before inspected a jobsite of the type here involved. He determined the composition of the soil "by sight and by texture" as he walked on it (Tr. 53).

In contrast to Mr. Wilkerson's somewhat nebulous testimony, the respondent offered the testimony of Daniel G. Longo, who holds a bachelor's degree in civil

---

7/ There was some testimony that the excavation contained some water on its floor and had a fissure in its wall, but this evidence was never sufficiently developed to establish a hazardous condition.

8/ At the time the accident occurred, no other inspectors were available in the area office (Tr. 128).

9/ I do not hold that such tests must be made in every instance. Where the instability of the soil is obvious to a layman's eye and can be adequately described in his testimony, there is no need for such testing.

engineering and a master's degree in soil engineering (Tr. 225). Mr. Longo has a considerable background in soil engineering and was readily qualified as an expert at the hearing (Tr. 227-228). On the morning of the hearing, Mr. Longo, together with some employees of respondent, went to the site in question and conducted an inspection of the soil which included a close examination of its composition by Mr. Longo (Tr. 228-229). Using a backhoe, he dug two pits adjacent to Manhole #4 (Tr. 232). He describes the first soil removed from the pits as "laminated shale and sandstone rock" (Tr. 233). At the four-foot level the backhoe encountered resistance because of the hard and compact nature of the soil, and he characterizes this as soil which has become rock by compression (Tr. 233-234). A careful study of the photographic exhibits (Exs. C-10, C-11, C-12, C-13, C-14) denigrates a conclusion that the walls of the excavation were composed of solid rock but does support a conclusion that the soil was tightly compressed and, therefore, stable as alleged by Mr. Longo (Tr. 237). While I am not inclined to accept Mr. Longo's testimony that the soil at Manhole #4 was "solid rock", I do accept his opinion that the soil involved showed no signs of instability and did not present a danger of moving ground in this area. This opinion is supported by the testimony of Robert J. Broshear, the job superintendent, who testified that he observed no sloughing off in the excavation nor any danger of moving ground (Tr. 153-154). Likewise, Jeff Chandler Gaston, an employee who actually worked in the excavation, said he would not have gone into the excavation had he considered it unsafe and noticed no instability of the soil (Tr. 211).

The Secretary has failed to prove that the conditions existing in Manhole #4 at the time of the inspection constituted a hazard of "moving ground." Since this is an essential element in establishing a violation of the standard, the citation will be vacated. See Carl E. Widell & Son, 77 OSAHRC 31/F8, 5 BNA OSHC 1163, 1976-77

CCH OSHD ¶ 21,015 (No. 15185); Seaward Construction Co., Inc., 77 OSAHRC 75/C5, 5 BNA OSHC 1422, 1977-78 CCH OSHD ¶ 21,803 (No. 8684); Richard G. Mugler Company, Inc., 75 OSAHRC 8/A13, 3 BNA OSHC 1771, 1975-76 CCH OSHD ¶ 20,074 (No. 12921); and C.T.M., Inc. v. O.S.H.R.C., 572 F.2d 262 (10th Cir. 1978).

## FINDINGS OF FACT

1. Respondent, V.I.P. Development, Inc., is a construction contractor engaged in the business of sewer line, water line and street construction at various subdivisions. At the time in question, respondent was engaged in sewer line excavations in Butler County, Ohio, at the Woodland Hills development site.

2. Respondent has employees who receive, handle, or otherwise work on goods or materials that have been moved in interstate commerce and/or employees who are engaged in the production of goods for shipment in interstate commerce.

3. During the course of the inspection at respondent's work site, William J. Wilkerson, the Secretary's agent, observed a Caterpillar 977 loader in use by respondent which did not have an audible reverse signal alarm in operative condition. While moving in reverse, the operator of the loader had a clear and unobstructed view in all directions and routinely looked in the direction in which the loader was moving.

4. Mr. Wilkerson also observed a Bucyrus Erie 350 excavator in use without an audible reverse signal alarm. This excavator, however, has a cabin with a 360-degree swing radius. When in operation, the operator can and does swing the cabin to face the direction in which the excavator is moving. The excavator is not a bidirectional piece of equipment within the meaning of the standard.

5. During the course of his inspection, Mr. Wilkerson observed an excavation referred to in the record as Manhole #4. This manhole was 9 feet deep, 9 feet wide and 15 to 15 1/2 feet long. The south, east and west walls of the manhole were vertical to the base of the excavation and were neither sloped nor shored. The composition of the soil was laminated shale and sandstone rock. A preponderance of the evidence reflects this soil was stable and did not present a hazard of moving ground.

## CONCLUSIONS OF LAW

1. The Commission has jurisdiction of the parties and subject matter in this case.

2. The respondent did not violate the provisions of 29 C.F.R. § 1926.602(a)(9)(ii).

3. The respondent did not violate the provisions of 29 C.F.R. § 1926.651(c).

## ORDER

It is ORDERED:

1. In accordance with the partial settlement agreement of the parties, which is hereby adopted and incorporated as a part of this decision, the settlement is approved and civil penalties in the amount of $380 are assessed in accordance with the agreement.

2. Serious Citation No. 1, item 5, is vacated.

3. Willful Citation No. 1 is vacated in its entirety.

Dated this 29th day of June, 1982.

| SECRETARY OF LABOR,<br><br>Complainant,<br><br>v.<br><br>KAISER ALUMINUM AND CHEMICAL CORP.,<br><br>Respondent,<br><br>UNITED STEELWORKERS OF AMERICA, LOCAL 5668,<br><br>Authorized Employee Representative. | OSHRC Docket No. 77-699 |

DECISION

Before: ROWLAND, Chairman; CLEARY and COTTINE, Commissioners.

BY THE COMMISSION:

The sole issue in this case is whether a violation of 29 C.F.R. § 1910.132(a) [1/] by Respondent, Kaiser Aluminum and Chemical Corporation ("Kaiser"), stemming from its failure to protect its employees from exposure to polychlorinated biphenyls, should be characterized as serious within the meaning of 29 U.S.C.

---

1/ Section 1910.132(a) provides:

§ 1910.132 General requirements.

(a) Application. Protective equipment, including personal protective equipment for eyes, face, head, and extremities, protective clothing, respiratory devices, and protective shields and barriers, shall be provided, used, and maintained in a sanitary and reliable condition wherever it is necessary by reason of hazards of processes or environment, chemical hazards, radiological hazards, or mechanical irritants encountered in a manner capable of causing injury or impairment in the function of any part of the body through absorption, inhalation or physical contact.

§ 666(j), section 17(k) of the Occupational Safety and Health Act of 1971, 29 U.S.C. §§ 651-678 ("the Act"). 2/ We conclude that the violation should be characterized as serious and reverse the judge's decision in part.

I

A polychlorinated biphenyl ("PCB") is one of a group of substances that consist of two phenyl molecules bonded together with one to ten chlorine atoms. Thus, a tetrachlorobiphenyl has four chlorine atoms on its basic biphenyl structure. Aroclor 1016 is a mixture of various PCB's manufactured by Monsanto Industrial Chemicals Company that is used as a conductive material in capacitors at Kaiser's Ravenswood, West Virginia facility. The capacitors weigh approximately 100 pounds and are stacked in rows on three different levels. Occasionally a capacitor's steel casing ruptures and the Aroclor 1016 spills out. Because of their relatively small size (they are 18 inches high, 6 inches wide and 24 to 30 inches long), their weight and location, the capacitors are difficult to remove when they rupture. They must be "manhandled" out by Kaiser's employees. During this operation, the Aroclor 1016 may spill onto the employee handling the capacitor.

During one such operation on October 17, 1976, Aroclor 1016 flowed onto the clothing and soaked the shirt of DeVilbiss, an electrician for Kaiser. Some of the Aroclor 1016 also entered his mouth. DeVilbiss, who was not wearing any

---

2/ Section 17(k), 29 U.S.C. § 666(j), states:

> For purposes of this section, a serious violation shall be deemed to exist in a place of employment if there is a substantial probability that death or serious physical harm could result from a condition which exists, or from one or more practices, means, methods, operations, or processes which have been adopted or are in use, in such place of employment unless the employer did not, and could not with the exercise of reasonable diligence, know of the presence of the violation.

type of personal protective equipment, also received 10 or 12 less severe exposures to Aroclor 1016 over a 5 or 6 month period before and after the day of this large spill. Other employees working with capacitors were also exposed. See note 11, infra. The amount of Aroclor 1016 released in all of the exposures was estimated by DeVilbiss to range from as much as a quart, which made his clothes stick to his body, to as little as a tablespoon. DeVilbiss testified that he experienced a foul taste in his mouth and noticed a reddening of his skin as a result of these exposures. DeVilbiss also testified that beginning in mid-October, 1976, he requested information from his foreman regarding the health hazards of PCB contact and the need for protective equipment. Despite almost daily requests, he received no response. DeVilbiss then contacted OSHA and was advised to use protective equipment, including a respirator if ventilation was not adequate. He reported this information to his foreman. After two more weeks of inaction by his foreman, DeVilbiss contacted his union. As a consequence, the worksite was inspected by OSHA in January 1977.

The Secretary issued a citation alleging that Kaiser had failed to comply with 29 C.F.R. § 1910.132(a) in that personal protective equipment was not used and maintained in a sanitary and reliable condition where employees were exposed to "PCB-type oil (Askarel) during replacement and clean-up of certain ruptured capacitors." The citation also alleged that the violation was "serious" within the meaning of section 17(k).

Lawrence J. Fine, M.D., assistant professor of occupational medicine at the Harvard School of Public Health, testified for the Secretary on the basis of his research into the literature on PCB's. Dr. Fine characterized Aroclor 1016 as a suspected carcinogen because it is similar in composition to other PCB mixtures, such as Aroclor 1254 and Aroclor 1260, that are associated with cancer in animals. Dr. Fine stated that the similarity among PCB mixtures is determined by the

number of chlorine atoms on the basic biphenyl molecule. He also testified that twenty-three or twenty-one percent of the same PCB components is found in both Aroclor 1016 and Aroclor 1254, and that Aroclor 1242 is made up of 88% of the same PCB components as Aroclor 1016. 3/

Dr. Fine stated that tumors of the skin and internal organs that could arise from an exposure to Aroclor 1016 "such as . . . the exposure that occurred

---

3/ The table partially reproduced below is from Kaiser's exhibit B, Lloyd et. al., Polychlorinated Biphenyls, 18 J. Occup. Med. 109, 110 (1976). It has been rearranged slightly and the columns of overlaps between Aroclors have been added. Although the data in the table may not have formed the basis of Dr. Fine's testimony, the similarities between the mixtures in the table are nearly identical to Dr. Fine's figures. The Aroclor 1016 used in Kaiser's capacitor is somewhat different from the Aroclor 1016 described in the table; the Aroclor 1016 used by Kaiser contains 39.5% chlorine by weight.

Description of PCB Mixtures.

| | Aroclor 1242* | Overlap between Aroclors 1242 & 1016 | Aroclor 1016* | Overlap between Aroclors 1242 & 1254 | Aroclor 1254* |
|---|---|---|---|---|---|
| Approximate Chlorine Content | 42% | | 42% | | 54% |
| Components | | | | | |
| Biphenyl | 0.1 | 0.1 | 0.1 | 0.1 | 0.1 |

*Weight-weight percent.

in [this case] . . . in 1976" might not appear for fifteen to thirty years after an exposure. He noted that PCB's are absorbed through the skin and that a melanoma caused by cutaneous exposures to PCB's could be metastasized throughout the body. 4/ He testified that the reddening of the skin experienced by DeVilbiss was the earliest sign of skin toxicity of PCB's. Chloracne, which he characterized as a "painful" and "very serious" form of skin eruption known to persist at least several months after exposure, was the next stage of skin toxicity of PCB's. 5/ Dr. Fine testified that PCB-induced cancer could develop 15 or 30 years after an initial exposure without evidence of acute toxicity such as skin reactions. Dr. Fine noted that in terms of carcinogenicity, toxicity cannot be measured without many years of observation. He therefore recommended that all skin exposures to Aroclor 1016 should and could be avoided through the use of nonporous personal protective equipment. 6/

---

4/ Dr. Fine also noted that the pancreatic cancer observed in a Mobil Oil Co. study of PCB exposed workers was probably due to both skin absorption and inhalation, resulting in PCB transportation through the bloodstream and storage in the pancreas. Liver and fatty tissue accumulation occur in the same manner.

5/ Dr. Fine identified other toxic effects of PCB exposure as: upper respiratory tract and mucous membrane irritation, stinging of the eyes, repugnant odor of the body; from ingestion by humans: blindness, central nervous system symptoms, nausea, loss of appetitie, and stillbirths and abnormal pigmentation of infants; in animals: lessened ability of birds to form eggs and decreased litter size.

6/ A Kaiser corporate memo of April 30, 1976 (Complainants' Exhibit F) states with respect to PCB's: "Their acute toxicity is low, chronic toxicity is high." The memo lists known toxic effects to include "acne-like skin eruption, pigmentation of the skin and nails, excessive eye discharge, swelling of eyelids and distinctive hair follicles." The memo also states that standard safety precautions were required, including eye protection, non-porous gloves and aprons, and "any skin area contacted should be thoroughly washed with water as soon as possible." A Monsanto guide on the handling of PCB's (Respondent's Exhibit A) also states that "prolonged or repeated skin contact" should be avoided "because of the possible occurence of a condition called chloracne." Monsanto also provided a sample caution label to be placed on containers of PCB solutions and transformers in which PCB solutions are used.

Dr. Fine acknowledged that the studies he relied on in reaching his conclusion regarding the health hazards of exposure to Aroclor 1016, principally a Japanese study of a 1968 outbreak of PCB poisoning in Japan due to ingestion of PCB contaminated rice oil and a report on a Mobil study of PCB exposed employees, did not involve exposure to the exact biphenyl compound in this case. Exposed populations in the Japanese study exhibited the following symptoms: chloracne, brown pigmentation of the skin and nails, distinctive hair follicles, increased eye discharge, swelling of eyelids, transient visual disturbance, systemic gastrointestinal symptoms including jaundice, low birth weights and skin discoloration in infants born to poisoned mothers. In addition, two stillbirths were reported. In some patients symptoms persisted for three years after PCB exposure terminated. Lloyd et al., Polychlorinated Bipenyls, 18 J. Occupational Med. 109 (1976)(Respondent's Exhibit B). 7/ The record in this case does not identify the exact PCB mixture involved in the Japanese poisoning. The Mobil PCB study involved 92 workers exposed to Aroclor 1254 and observed eight cancers in seven workers, including malignant melanomas and cancer of the pancreas. The study was reported in a letter to the editor in the New England Journal of Medicine on August 19, 1976. Former NIOSH Director Finklea reported these PCB developments in the American Industrial Hygiene Association Journal in October, 1976 (Respondent's Exhibit C). Dr. Finklea noted that although the Mobil study was the first to suggest a correlation between animal or human PCB exposure and skin or pancreatic cancer, hepatomas and hepatocellular carcinomas had been reported in laboratory animals fed Aroclor 1254 and 1260. Dr. Fine also testified that although the exposures in this case are probably lower than those

---

7/ The Lloyd article also noted reported instances of digestive disturbances, face and head edema, burning of the eyes, impotence and hematurea related to human PCB exposure.

reported in the Mobil study, the skin exposure in this case had already caused mild toxicity. Dr. Fine also noted that the Japanese study suggested that the "minimum toxic dose" for humans is between 0.5 and 2 grams, which, he stated, is at least equivalent to 0.5 to 2 cc of PCB ingested. 8/ He testified that for the purpose of comparison there are 242 cc in a cup. In his view the exposures in this case "can be compared with the levels of exposure" discussed in the literature on PCB toxicity.

Judge Usher found that Kaiser failed to comply with 29 C.F.R. §1910.132(a). He found that the Secretary had failed to prove the violation was serious because the Secretary's expert witness, Dr. Fine, "did not testify with any specificity concerning what level of exposure to Aroclor 1016 would, or even might, have a carcinogenic effect upon humans, although he warned that cutaneous exposure . . . should be avoided completely . . . ." He stated that Dr. Fine had failed to "state an informed opinion" that there is a substantial probability that death or serious physical harm could result from the exposures of DeVilbiss to Aroclor 1016 on 10 or 12 occasions during the five or six-month period in question. The judge cited Usery v. Hermitage Concrete Pipe Co., 584 F.2d 127 (6th Cir. 1978).

The Secretary filed a petition for review of this portion of the judge's decision. The petition was granted by Commissioner Cottine.

---

8/ The term "minimum toxic dose" was not defined by Dr. Fine. The National Institute of Occupational Safety and Health's ("NIOSH") 1978 Registry of Toxic Effects of Chemical Substances xxiii (1979) defines "Toxic Dose Low" (TDLo) as:

> --the lowest dose of a substance introduced by any route, other than inhalation, over any given period of time and reported to produce any toxic effect in humans or to produce carcinogenic, neoplastigenic, teratogenic, or mutagenic effects in humans or animals.

The PCB mixture ingested in Japan was evidently Kanechlor 400, which is 48% chlorine. The 1978 Registry lists a TDLo for toxic effects on skin of 28 mg/kg of body weight by oral ingestion for Kanechlor 400. If DeVilbiss weighed 70 kg. (154 lbs.), then the TDLo for him would be 1.96 grams.

II

Before the Commission the Secretary argues that Dr. Fine's testimony establishes that there is no safe level of exposure to PCB's and that there is a substantial probability that death or serious physical harm could result from exposure to PCB's. He relies on the Sixth Circuit's decision in Hermitage Concrete. He further argues that where a single exposure to a toxic substance would not give rise to serious physical harm, but chronic exposure would, the Commission should, in the absence of evidence of chronic exposure, presume that the measured overexposure was representative of long-term exposure. The Secretary argues that the Commission should characterize Kaiser's failure to comply with the standard as serious because DeVilbiss was exposed to levels of PCB's that if experienced regularly could result in serious physical harm or death.

Kaiser maintains that all the Secretary has shown is that death and serious physical harm could result from exposure to certain levels of PCB's, but not that death or serious physical harm could result from the conditions shown to exist at Kaiser's plant. Kaiser contends that the Secretary's argument amounts to a claim that any exposure to a PCB is serious. Kaiser maintains that the Secretary disavowed this approach in his brief to the court of appeals in Hermitage Concrete and that the Commission has repeatedly rejected it.

The authorized employee representative, the United Steelworkers of America, Local 5668 ("Union"), also is a party to this proceeding. The union argues that the Secretary has established that as a result of the exposures in this case, employees could, if left unprotected, contract the illnesses associated with PCB exposure. The union maintains that the failure of Kaiser to comply with section 1910.132(a) constitutes a serious violation of the Act because the contraction of virtually all forms of cancer and the more severe forms of skin eruption and eye irritation create a substantial probability that death or serious physical harm could result.

III

With respect to violations of safety standards, the Commission has consistently held that an accident need not be shown to be substantially probable in order to hold that a violation is serious. The record need only show that an accident could have resulted and that, if an accident occurred, death or serious physical harm was substantially probable. See, e.g., Frank Swidzinski Co., 81 OSAHRC 4/E14 9 BNA OSHC 1230, 1981 CCH OSHD ¶ 25,129 (No. 76-4627, 1981). Court decisions have also been consistent on this point. See, e.g., East Texas Motor Freight v. OSHRC, 671 F.2d 845, 849 (5th Cir. 1982); California Stevedore & Ballast Co. v. OSHRC, 517 F.2d 986 (9th Cir. 1975).

We have followed a parallel course with respect to violations of health standards. We have not required that contraction of a serious disease be shown to be substantially probable. Instead, we have inquired whether a disease could result from the violative condition and whether there is a substantial probability of death or serious physical harm if the disease does occur. Thus, in Anaconda Aluminum Co., 81 OSAHRC 27A/A2, 9 BNA OSHC 1460, 1474-77, 1981 CCH OSHD ¶ 25,300, p. 31,347-31,349 (No. 13102, 1981), we held that a violation of a specific permissible exposure level for a toxic agent was serious because the level was set to prevent the possible contraction of cancer, a life-threatening disease. The Commission specifically rejected its previous holdings that the Secretary must demonstrate a substantial probability that death or serious physical harm would result from the violative condition. Our approach in Anaconda was consistent with that of the Sixth Circuit in Hermitage Concrete, which pointed out with respect to the contraction of silicosis that the proper inquiry was whether the cited conditions "might" cause unprotected employees to contract silicosis, and "if they might, whether there was a 'substantial probability' that the result would be serious physical harm or death." 584 F.2d at 131-34 & n.5.

Inasmuch as Kaiser has not been found to have violated a standard with a specific exposure level, we must look to the seriousness of the specific hazards to which the employee was exposed. Mahone Grain Corp., 81 OSAHRC 108/B8, 10 BNA OSHC 1275, 1279, 1981 CCH OSHD ¶ 25,836, p. 32,317-2 (No. 77-3041, 1981). Thus, the issue is whether the exposures experienced by Kaiser's employees could cause a disease and, if the disease is contracted, whether there is a substantial probability of death or serious physical harm.

Dr. Fine's unrebutted testimony establishes that Aroclor 1016 is closely related to a number of PCB mixtures that have been associated with human and animal carcinomas. His unrebutted testimony also establishes that malignant tumors of the skin and internal organs could appear in fifteen to thirty years following exposures such as those that occurred in this case, without evidence of acute toxicity. It was for this reason that Dr. Fine stated that cutaneous exposure to Aroclor 1016 should be prevented entirely.

The record further establishes that chloracne could result from the PCB exposures in this case. In examining whether chloracne constitutes serious physical harm, we note that Dr. Fine characterized it as a "painful" and "serious form of skin eruption." He stated that it would be the next stage in skin toxicity after the reddening of the skin experienced by DeVilbiss. In GAF Corp., 81 OSAHRC 29/A2, 9 BNA OSHC 1451, 1981 CCH OSHD ¶25,281 (No. 77-1811, 1981), appeal withdrawn, No. 81-4091 (2d Cir. September 3, 1981), the Commission found an employer in serious violation of the Act for exposing its employees to silver compounds that caused irreversible argyria, a permanent, bluish-black discoloration of the skin and eyes. 9/ The Commission "reject[ed] the notion that a

---

9/ We note that the documentary evidence in this case, including Kaiser's own corporate memo, includes skin and nail pigmentation as a toxic effect of PCB exposure.

worker's substantial sacrifice of his or her appearance is anything less than serious." 9 BNA OSHC at 1457, 1981 CCH OSHD at p. 31,246. We find the severity of the harm substantial enough to characterize chloracne as "serious physical harm."

Accordingly, we conclude that the failure to provide any personal protective equipment to protect against employee exposure to PCB is a serious violation of the Act because there is a substantial probability that death or serious physical harm could result from the short- and long-term effects of PCB exposure. 10/ See notes 4-7 and accompanying text, supra, for a general discussion of the evidence on clinical manifestations of PCB exposure. 11/

Judge Usher found that the violation was an other-than-serious violation and assessed a $210 penalty, the same amount that had been proposed by the

---

10/ The Secretary requests the Commission to take official notice of the NIOSH publication, Criteria for a Recommended Standard . . . . Occupational Exposure to Polychlorinated Biphenyls (PCBs) (1977), a document evidently not available until after the hearing. The NIOSH document is primarily a compilation of studies and publications, many of which are already part of the record in this case. Because the present record supports the Secretary's characterization, it is unnecessary to take official notice of the document. Accordingly, we decline the Secretary's request.

11/ In Hermitage Concrete Pipe Co., 82 OSAHRC 14/A2, 10 BNA OSHC 1517, 1982 CCH OSHD ¶ 25,975 (No. 4678, 1982), on remand from 584 F.2d 127 (6th Cir. 1978), the Commission addressed the seriousness of a violation involving excessive exposure to a toxic substance. We held that proven exposures at a worksite are presumed to be representative of typical exposures or work conditions in the absence of contrary evidence. The evidence in this case establishes that DeVilbiss received 10 or 12 exposures over a 5 or 6 month period. DeVilbiss also testified that PCB spillage was a regular occurrence when capacitors were moved, exposing not only him but clean-up crews and electricians as well. DeVilbiss stated that as late as January and February of 1977 he observed electricians who worked on the capacitors become contaminated with the same spilled substance. According to DeVilbiss, the electricians he observed in February were wearing "white plastic covered paper suit[s]" that did not prevent the liquid from soaking through. Kaiser stated in its post trial brief that a protective equipment requirement was not adopted at its cited worksite until mid-January, 1977. Accordingly, the evidence establishes continuous employee exposure to a PCB mixture and application of a presumption of representativeness is unnecessary in this case.

Secretary for the alleged serious violation. We conclude that $210 is an appropriate penalty. Accordingly, we characterize the violation as serious with the meaning of section 17(k) and assess a $210 penalty.

SO ORDERED.

FOR THE COMMISSION

Ray H. Darling, Jr.

Ray H. Darling, Jr.
Executive Secretary

DATED: JUL 30 1982

ROWLAND, Chairman, dissenting:

I agree with Judge Usher that the Secretary failed to prove that the violation of section 1910.132(a) was serious. In reaching this conclusion, I do not decide whether the majority's interpretation of section 17(k) of the Act is correct. It is enough to observe that even under the majority view the evidence, particularly the testimony of Dr. Fine, the Secretary's expert witness, does not establish that the exposures received by Kaiser's employee could cause cancer. 12/

First, Dr. Fine's testimony consisted of little more than conclusions he drew from reading the scientific literature on PCB's. Dr. Fine had never conducted any studies on the effects of PCB's or treated any cases of PCB toxicity. Although Dr. Fine briefly referred to one study on Aroclor 1016, which he did not clearly identify, the study was not directed to the toxic effects of Aroclor 1016. Indeed, Dr. Fine testified that he was unaware of any adequate studies of carcinogenesis in animals from Aroclor 1016. With the exception of a brief account in a medical journal of the Mobil study, the record contains none of the literature on any PCB that Dr. Fine relied upon. While this method of introducing

---

12/ The Secretary also asks the Commission to take official notice of the NIOSH criteria document for PCB's. See note 10 of the lead opinion. He made the same request of the judge in his post-hearing memorandum. The judge refused to admit the criteria document, noting that the record in the case was closed and the Secretary had not shown good cause for reopening it. The judge was evidently of the view that taking official notice of the criteria document would unduly delay a final adjudication.

Whether to take official notice is a matter within the discretion of the judge. I cannot say that his decision failed to strike the proper balance between the need for a correct decision and the need for finality in litigation, nor does the Secretary claim that the judge abused his discretion. Moreover, many of the numerous studies referred to in the criteria document were in existence before the hearing. The Secretary should have made an effort to determine what information was relevant and introduced it at the hearing rather than waiting until after the hearing to attempt to put in the entire compendium. See Seattle Crescent Co., 79 OSAHRC 91/A2, 7 BNA OSHC 1895, 1898-99, 1979 CCH OSHD ¶ 24,002, p. 29,133 (No. 15242, 1979).

expert opinion may be permissible under Fed. R. Evid. 703, the probative value of Dr. Fine's opinion would have been greater if the literature itself were introduced into evidence or at least described with greater specificity than Dr. Fine described it. In this way, Dr. Fine's conclusions could have been more intelligently evaluated. Cf. Air-Kare Corp., 81 OSAHRC 98/A2, 10 BNA OSHC 1146, 1981 CCH OSHD ¶ 25,758 (No. 77-1133, 1981)(dissenting opinion)(lay opinion testimony).

Second, Dr. Fine's testimony is too indefinite to support the majority's finding. Dr. Fine testified that Aroclor 1016 is similar to Aroclor 1242 and Aroclor 1254, which have been "associated with cancer" in man and animals, because there is a 23% "overlap" between the ingredients of Aroclors 1016 and 1254 and a 88% "overlap" between the ingredients of Aroclors 1016 and 1242. It is apparently for this reason that Dr. Fine concluded that the effects of Aroclor 1016 would be similar to those of the other Aroclors and that exposures such as the ones in this case could cause skin cancer and tumors in fifteen to twenty years. However, Dr. Fine did not testify with any specificity what levels of exposure to Aroclors 1242 and 1254 had resulted in the contraction of cancer. The only study involving employee exposure relied on and identified by Dr. Fine stated that "Aroclor 1254 was used . . . during a nine year period," and that workers were "believed to have been heavily exposed to" it. 295 New England J. Med. 450 (1976). The record evidence, particularly Dr. Fine's testimony, does not afford a basis to compare the exposures in this case with the exposures relied on by Dr. Fine.

Similarly, Dr. Fine's testimony that the exposures received by Kaiser's employees could be compared to exposures in some of the other studies he researched is unconvincing. Dr. Fine noted that 0.5 to 2 cc was equivalent to 0.5 to 2 grams, which he characterized as a "minimum toxic dose" on the basis of a

Japanese study. However, the substance in the Japanese study was evidently not Aroclor 1016. See note 8 supra. In addition, Dr. Fine did not define the term "minimum toxic dose." Assuming as the majority does that the term "minimum toxic dose" may be equated with "toxic dose low," the record still does not show that this dose could have caused serious physical harm. The term "toxic dose low" is defined as "the lowest dose of a substance . . . over any period of time . . . reported to produce any toxic effect." National Institute of Occupational Safety and Health, 1978 Registry of Toxic Effects of Chemical Substances xxiii (1979)(emphasis added). Toxic effect is defined as "any reversible or irreversible noxious effect on the body." Id. at xxii. Thus, even if DeVilbiss received the "toxic dose low," there is no way to know whether his exposure could have resulted in serious physical harm. In addition, there is no indication that cancer was the toxic effect suffered in the Japanese exposures. Furthermore, those exposures to PCB were caused by rice oil that was contaminated with PCB's and ingested over a period of months. By contrast, although an unspecified quantity of Aroclor 1016 entered DeVilbiss' mouth on one occasion, there is no evidence of the amount of PCB that he might have swallowed or otherwise ingested. The long-term ingestion noted in the Japanese study is clearly not equivalent to the ingestion, if any, by DeVilbiss. Accordingly, it would be difficult to reach any conclusion as to the effect of exposure to Aroclor 1016 from such data.

Dr. Fine's recommendation of a zero exposure limit for skin exposure is also lacking in probative value. The recommendation was based more on the ease with which nonporous personal protective equipment can be used than on the toxicity of PCB's. Dr. Fine stated, "I would think zero exposure should be the recommendation [for skin exposure], since personal protective equipment can always be used to reach that objective."

In view of these facts and the Secretary's failure to elicit from Dr. Fine testimony that fully explains the significance of the similarities among PCB's or that compares the exposures received in this case with exposures that resulted in the contraction of cancer, I must agree with the judge that Dr. Fine "did not testify with any specificity concerning what level of exposure to Aroclor 1016 . . . might have a carcinogenic effect upon humans" and that he did not state "an informed opinion." Accordingly, I conclude that the evidence does not support the conclusion that the exposures received by Kaiser's employee could cause cancer.

The majority's conclusion with respect to chloracne is similarly unsupported. Dr. Fine's testimony as to chloracne was very limited. He stated, without explanation, that chloracne is a painful and "very serious form of skin eruption," that "looks like teenage acne." Dr. Fine never explained what he meant by the conclusory term "very serious" nor did he testify as to the degree of pain experienced during this sort of skin eruption. On the whole, Dr. Fine did not describe chloracne with sufficient specificity to enable the Commission to make an informed judgment on the severity of chloracne. In sum, the record fails to show that chloracne causes the sort of discomfort or deprivation of bodily function contemplated by section 17(k). See GAF Corp., 81 OSAHRC 29/A2, 9 BNA OSHC 1451, 1459, 1981 CCH OSHD ¶ 25,281, p. 31,248 (No. 77-1811, 1981)(dissenting opinion), appeal withdrawn, No. 81-4091 (2d Cir. September 3, 1981).

Accordingly, I conclude that Kaiser's failure to comply with 29 C.F.R. § 1910.132(a) was not shown to be serious within the meaning of section 17(k). I also conclude that the judge's penalty assessment of $210 was correct, and I note that Kaiser does not except to this assessment. Judge Usher's decision should therefore be affirmed.

for Local Union

USHER, Judge:

These proceedings, initiated by the Secretary of Labor, United States Department of Labor, pursuant to Section 10(c) of the Occupational Safety and Health Act of 1970, 29 U.S.C. 651, et seq. ("the Act"), involve a January 28, 1977, Citation charging a "serious" violation of Section 5(a)(2) of the Act because of Respondent's alleged failure to comply with the

requirements of the safety standard promulgated by Complainant and codified at 29 CFR 1910.132(a). Complainant seeks affirmance of that Citation, which resulted from an inspection of Respondent's Ravenswood, West Virginia, plant in January 1977, and seeks the assessment of a $210 penalty.

Respondent's Notice of Contest placed the alleged violation in issue; a Complaint and Answer followed in conformance with the Commission's Rules of Procedure; and the issues were tried before me at Charleston, West Virginia on August 8 and 9 and October 18, 1977. Employee representatives appeared, elected party status, and participated fully.

The parties entered stipulations concerning Respondent's corporate status, its engagement in interstate commerce, and the jurisdiction of this Commission. Goods processed at the work site, valued in excess of $100,000, are shipped on an interstate basis, and approximately 3,200 persons are employed there.

Complainant and Respondent have submitted post-trial briefs. The Union has not.

The Issues.

The pleadings, evidence adduced by the parties, arguments of counsel, and post-trial briefs have served to raise the following basic issues:

1. Whether Respondent committed the violation alleged by Complainant;

2. If Respondent violated the Act, as charged, whether that violation is properly characterized as a "serious" violation, as defined in Section 17 of the Act; and

3. If Respondent violated the Act, what penalty, if any, should be assessed.

The Ancillary Issues.

In its brief, filed subsequent to the trial of the issues, Respondent raised several ancillary issues, viz.:

1. Whether the cited standard is "unenforceably vague";

2. Whether the Citation was issued "with reasonable promptness" as required by Section 9(a) of the Act;

3. Whether the Citation is defective because of its issuance more than six months after the alleged violation occurred (Section 9(c) of the Act);

4. Whether Complainant can amend the Citation "to add shoe coverings to the list of personal protective equipment specified in the Citation";

5. Whether an alleged violation, which was not observed by Complainant's agent, can be charged in view of the provisions of Complainant's Field Operations Manual, Chapter X, subparagraph D(1).

Discussion.

The cited safety standard (29 CFR 1910.132(a)) is not "unenforceably vague." See McLean Trucking Company v. OSHRC, et al., 503 F.2d 8 (4th Cir. 1974).

The Citation, issued initially on January 28, 1977, refers on its face to a violation discovered during the period January 6 to January 27, 1977. That Citation was amended on February 14, 1977, as follows:

The violations [sic] described in this citation are [sic] alleged to have occurred on or about October 17, 1976.[1/]

Respondent contends in its Answer that the Citation "was issued in violation of Section 9(c) of the Act." Section 9 of the Act provides, in pertinent part:

---

1/ On July 29, 1977, 10 days prior to the commencement of the trial, Complainant moved to amend his Citation and complaint (for the second time) to charge:

> On or about October 17, 1976, and on several other occasions between October 17, 1976 and January 12, 1977, Respondent was in serious violation of 29 U.S.C. §654(a)(2) and 29 CFR 1910.134(a) [sic] at its Ravenswood, West Virginia plant in that protective equipment, such as impervious gloves, impervious aprons, goggles, and respirators was not utilized and maintained in sanitary and reliable condition where it was necessary [by] reason of employee exposure to PCB-type oil (askarel) in the basement area, at control panels for induction furnaces, during replacement and cleanings of certain ruptured capacitors.

The motion was granted only insofar as it amended the Citation to charge a violation "on or about October 17, 1976 and on or about January 12, 1977." The motion to amend the Citation to charge a violation (or violations) "on several other occasions between October 17, 1976 and January 12, 1977" was denied.

See Transcript, pp. 314, 315.

> Sec. 9. (a) If, upon inspection or investigation, the Secretary or his authorized representative believes that an employer has violated a requirement of section 5 of this Act, of any standard, rule or order promulgated pursuant to section 6 of this Act, or of any regulations prescribed pursuant to this Act, he shall with reasonable promptness issue a citation to the employer....
>
> * * *
>
> (c) No citation may be issued under this section after the expiration of six months following the occurrence of any violation.

The Citation, dated January 28, 1977, (as amended) charges a violation which is alleged to have occurred on either October 17, 1976, or January 12, 1977 (or on both dates). Six months did not elapse between the earlier of the two alleged violation dates and the issuance date. The July 29, 1977, amendment relates back to the date of the issuance of the Citation, and Respondent has demonstrated no prejudice resulting from the amendment. Rule 15(c), Federal Rules of Civil Procedure, governs. See Southern Colorado Prestress Co. v. OSHRC, et al., ____ F.2d ____, 6 BNA OSHC 2032, CCH OSHD para. 23,247, (10 Cir., November 6, 1978). Thus, the Section 9(c) issue has not been properly raised.

The Commission has frequently addressed the "reasonable promptness," requirement of Section 9(a) of the Act. It is now settled that that defense is an affirmative one; it must be raised by Respondent, and its elements must be proved by Respondent. Lack of "promptness" in its issuance will support the avoidance of a Citation only if the delay was "so unreasonable as to be unconscionable," or if Respondent "was prejudiced as a result of the delay" Secretary of Labor v. Par Construction Co., Inc., OSHRC Docket No. 11092, CCH OSHD para. 21,216 (and cases cited therein). Respondent has attempted to prove neither of these facts; thus its asserted defense must fall.

Complainant's "motion to amend the citation to conform to the evidence and add shoe coverings to the list of personal protective equipment that has been set forth on the Citation, as amended" (Tr. p. 538) is well founded in fact, and it is granted.

Respondent has moved for dismissal of the Complaint and vacation of the Citation because "it was issued in violation of the [Complainant's] Field Operations Manual [which requires that] 'working conditions that allegedly violate [the Act]...shall be cited only when observed by a CSHO during an inspection.'" The record discloses that the Compliance Safety and Health

Officer ("CSHO") did not, in this instance, observe the alleged violation as described by employee witnesses at the trial. Nevertheless, Respondent's point is not well taken. See Secretary of Labor v. H-30, Inc., OSHRC Docket No. 76-752, CCH OSHD para. 22,050, and cases cited therein. If the violation alleged by Complainant is proved by credible and substantial evidence, it matters not whether the CSHO actually observed the conditions which are alleged to have been violative of the Act. "Noncompliance with instructions in the manual is therefore not a basis for invalidating a citation." H-30, Inc., supra.[2/]

The Alleged Violation.

The alleged violation concerns Section 5(a)(2) of the Act and the safety standard promulgated by Complainant and codified at 29 CFR 1910.132(a) which requires:

> Protective equipment, including personal protective equipment for eyes, face, head and extremities, protective clothing, respiratory devices, and protective shields and barriers, shall be provided, used, and maintained in a sanitary and reliable condition wherever it is necessary by reason of hazards of processes or environment, chemical hazards, radiological hazards, or mechanical irritants encountered in a manner capable of causing injury or impairment in the function of any part of the body through absorption, inhalation or physical contact.

Complainant has charged that

> [p]rotective equipment was not used and maintained in a sanitary and reliable condition where it was necessary by reason of hazards encountered in a manner capable of causing injury or impairment in the function of any part of the body:
>
> (a) basement area, at control panels for induction furnaces, where employees were exposed to PCB-type oil (Askarel) during replacement and clean-up of certain ruptured capacitors.

Capacitors[3/] containing "Aroclor 1016," a PCB-type[4/] oil, are located in the casting department building at the basement level below the induction furnaces. These capacitors fail from time to time and the failure frequently

---

2/ The Field Operations Manual has since been reworded (in August 1978) to eliminate the apparent dilemma faced by Compliance Safety and Health Officers who are informed of violations which they do not actually observe.

3/ Devices, about 18 inches by 5 inches by 24 to 30 inches consisting of conducting plates separated by insulating material, used for the storage of electrical charge.

4/ Polychlorinated Biphenyls

involves a rupture of the steel casing and the spilling of its contents. Deactivation of the circuits, physical removal of the damaged capacitors, and their replacement are the assigned job duties of electricians. Maintenance employees later clean the area of the spilled material. The capacitors weigh approximately 100 pounds, and two employees working together lift them from the cabinets in which they rest while in operation. No mechanical devices of any kind are provided for their removal. They have to be "manhandled." Depending upon the location of the capacitor to be removed (higher or lower in the cabinet) it may have to be "tilted forward...which causes the oil inside...to pour out...[and to] run down [the] arms and the rest of [the] body" of the employee.[5/] Asked if the contents of the capacitors come in contact with the employee as he removes it, Complainant's witness, Charles De Vilbiss, replied, "That was usually the case."

Mr. De Vilbiss has been removing and replacing capacitors since he began his employment at Respondent's Ravenswood plant on July 27, 1976, and from that time until October of that year he removed an estimated five or six. From about the middle of October 1976, and for the next four weeks he removed another five or six. During that period Respondent did not furnish him with impervious gloves, aprons, or other such clothing or equipment. He was not required to wear goggles or other eye protection.[6/] Admittedly, Respondent did not adopt "a protective equipment requirement...at Ravenswood...for employees who were working with failed capacitors...until January 13, 1977" (post-trial brief, pp. 3, 4). Beginning in about mid-October of 1976, Mr. De Vilbiss inquired of his foreman on an almost daily basis regarding the need for such protective equipment. Specifically, he asked his foreman to "look into" the possibility of a health hazard resulting from his physical contact with the polychlorinated biphenyls substance.

On October 17, 1976, according to the testimony, Mr. De Vilbiss and another electrician removed five capacitors, as instructed, and the PCB liquid spilled on his shirt and pants.[7/] His "shirt was saturated with it" and it

---

5/ Tr. p. 325, 327.

6/ Tr. p. 328.

7/ On direct examination the witness referred to "a quart of oil...possibly [being] doused down"; on cross-examination he estimated that 4 to 8 ounces of the oil were spilled on October 17, 1976.

soaked through the clothing onto his skin. He also got some in [his] mouth...[and] rinsed [it] out." Two days later, on "about the 19th [of October, 1976]," Mr. De Vilbiss witnessed the clean-up employees cleaning the spilled fluid from the floor. They were not wearing protective gloves or other such clothing.

Summary and Evaluation of the Evidence.

The record fully substantiates Complainant's allegation that Respondent's employees' duties necessitated their having body contact with a fluid containing a compound which is generally known as a polychlorinated biphenyl (PCB).[8/] The evidence likewise supports the allegation (as admitted by Respondent) that personal protective equipment to prevent body contact with the fluid was not provided, used, and maintained by Respondent at its Ravenswood plant at the time of the alleged violation. Its use was first required on or about January 13, 1977.

Respondent argues correctly that Complainant must prove employee exposure to a "substance [which is] chemically hazardous" and must prove further that the exposure was "in a manner capable of causing injury or impairment in the function of any part of the body through absorption, inhalation or physical contact," citing Secretary of Labor v. Imco Container Company, OSHRC Docket No. 79, 1 BNA OSHC 1266. In Imco the Commission vacated the citation because Complainant failed to prove "a crucial fact [viz.] prolonged or repeated exposure." The allegedly offending substance in that case, "Stoddard solvent," was adjudged to be not a "skin irritant," but one with which only "frequent or prolonged contact" was to be avoided.

The offending chemical being considered here is a part of the chemical family known as polychlorinated biphenyls (PCBs), and there are differing views concerning what, if any, exposure to that agent is safe. The manufacturer, Monsanto Company, has advised in its bulletin (Exhibit R-A) that "prolonged contact" with the skin "may lead to drying and chapping of the skin...[but] no serious skin irritation will occur as the result...if [it is accidentally spilled on the hands]." (Emphasis added.) In the same vein, Monsanto's bulletin advises, "Prolonged or repeated skin contact...must be avoided by the use of gloves and protective garments."

---

8/ Also known as "Askarel" and marketed under the trade name "Aroclor 1016."

The U.S. Congress has recognized at least the potentially dangerous characteristics of PCBs by providing for the control of its manufacture, use, and disposal.[9/]

The testimony of Lawrence J. Fine, M.D., was most enlightening and convincing. Doctor Fine, a Board-certified internist, is Assistant Professor of Occupational Medicine at the School of Public Health, Harvard University. He is also Board certified in occupational medicine. See Exhibit C-J.

The doctor stated that he conducted research in public literature concerning polychlorinated biphenyls and concluded, "...there are toxic affects, both described on animals and in studies of workers who have been exposed to PCBs." In terms of worker exposures, he said, "there is one reported association of cancer of the pancreas and malignant melanoma." With regard to skin affects, "...chloracne is the toxic skin affect, [and]...there's a description [in the literature he reviewed] of upper respiratory tract and mucous membrane irritation, burning, stinging of the eyes, et cetera." The dire consequences of cancer inducement, he admitted, resulted from exposure to "Aroclor 1254." Respondent's employees were exposed to "Aroclor 1016," a different formulation of PCB, the difference being the number or amount of chlorine atoms in the basic biphenyl molecule. His study of the published materials which have been made available to him has led to his conclusion: "'Aroclor 1016' is a cancer-suspect agent." He stated his reasons for that conclusion in some detail (Tr. p. 420).

Doctor Fine explained that should cancer be the result of exposure to PCBs, it would not be apparent immediately. The "latency period" may be 15 to 30 years.

Having heard the testimony of the employee witness, Doctor Fine regarded the vaguely-described redness of the skin as "the earliest sign of skin toxicity to PCBs...[t]he next stage would be chloracne...a skin disease that has been recognized...for several decades in workers who are exposed to PCBs and other chemicals like them...a very serious form of skin eruption...known to persist for at least several months after exposure to PCBs...painful."

In the doctor's judgment, "...zero exposure [to PCBs]...for the cutaneous route" should be the recommendation. He advised the use of

---

9/ Toxic Substances Control Act, 15 U.S.C. 2601; Public Law 94-469, October 11, 1976.

"non-porous personal protective equipment" to avoid skin contact with substances containing PCBs.

Respondent argues that Complainant has failed to show that a reasonable man would have recognized the existence of a hazard in the incident occurring on or about October 17, 1976, citing Secretary of Labor v. Tobin Packing Co., Inc., OSHRC Docket No. 15858, 5 BNA OSHC 1685; Secretary of Labor v. Process Engineering, Inc., OSHRC Docket Nos. 12097 and 12098, 4 BNA OSHC 1771; and Cape and Vineyard Division, etc. v. OSHRC, 512 F.2d 1148 (1st Cir. 1975). The "reasonable man" test has been applied not only by the Review Commission, but also by the Courts of Appeals, in determining when, and to what extent, compliance with this standard's requirements is mandated by the surrounding circumstances. See McLean Trucking Co. v. OSHRC, et al., supra, and Ryder Truck Lines, Inc. v. Brennan, 497 F.2d 230 (5th Cir. 1974).

As in McLean, "...the totality of the foregoing elements was sufficient to convey to [this Respondent] a reasonable understanding of the conduct required of it by 29 CFR 1910.132 [Citation omitted]" (503 F.2d at page 10). The host of informational sources which led Doctor Fine to conclude that protective equipment should be utilized when handling PCBs was equally available to Respondent, and it was available well before October 1976. More specifically, Mr. Robert Kasberger, the industrial hygienist and environmentalist at Respondent's Ravenswood facility (and seemingly the "head" of the "Ravenswood Environmental Control Group"), was specifically alerted to the potentially harmful effects of exposure to PCBs by the Service Sales Engineer, General Electric Company, in a letter dated June 12, 1975. (Complainant's Exhibit H.) Furthermore, Respondent itself issued an advisory bulletin from its corporate headquarters, dated April 30, 1976, regarding the "purchase, handling, use and disposal of...PCBs—Polychlorinated Biphenyls." It was recommended in that bulletin, among other things, "[s]tandard precautions are required—eye protection, non-porous gloves and aprons"—in the handling of PCBs. (Complainant's Exhibit F.) Thus, the totality of the circumstances was sufficient to convey to Respondent's supervisory personnel (at the Ravenswood facility) a reasonable understanding of what was required by the cited standard. Nevertheless, "a protective equipment requirement was not

adopted [there] for employees who were working with failed capacitors [leaking PCBs]...until January 13, 1977...because, in the judgment of the person responsible for implementing such a requirement, Robert Kasberger...the exposure of the persons working with the failed capacitors was not that great" (Respondent's post-trial brief, pages 3, 4).[10/]

It is abundantly clear that Mr. Kasberger's assessment of the cited conditions was erroneous, and his judgment was faulty. The exposure of persons working with the erupted capacitors was sufficient to warrant the required use of protective equipment, including personal protective clothing and equipment for eyes, face, head, body and extremities. The hazard to the exposed employees was capable of causing injury or impairment of bodily function.

Characterization of the Violation; Serious or Other-Than-Serious.

It has long been established that Complainant bears the burden of proving, by a preponderance of the evidence, all necessary elements of the asserted violation. National Realty and Construction Co., Inc. v. OSHRC, et al., 489 F.2d 1257 (D.C. Cir. 1973).

Complainant relies primarily on the testimony of Doctor Fine to prove not only the violation but its seriousness. Doctor Fine characterized PCBs (generally) as suspected cancer-inducing agents; he "believes that [Aroclor] 1016 is a suspected carcinogen;" and he explained that "Aroclor 1260 and Aroclor 1254 have been found to cause cancer in animals." He stated, too, that Aroclor 1254 "has been associated with...cancer inducement" in humans, and Aroclor 1016 "is similar [to] Aroclor 1260 and Aroclor 1254." Significantly, however, the doctor did not testify with any specificity concerning what level of exposure to Aroclor 1016 would, or even might, have a carcinogenic effect upon humans, although he warned that cutaneous exposure to that substance (indeed, all PCBs) should be avoided completely: "...one wants to avoid all exposure to 1016, so if we're talking about exposure through the skin, cutaneous route, then I would recommend the use of personal protective equipment, non-porous personal equipment." The doctor testified about the "Mobile Oil study," but Respondent's Exhibit C indicates that the exposure of employees of Mobile Oil Corporation, who are

---

10/ See also Tr. pp. 401-412.

suspected of ha[illegible] contracted cancer as the result o[illegible]rking with PCBs, is unknown. According to a report in The New England Journal of Medicine in 1976 (Respondent's Exhibit E) the studied workers at Mobile were "believed to have been heavily exposed to Aroclor 1254."[11/]

The evidence adduced substantiates the conclusion that Respondent's employee (De Vilbiss) was exposed to Aroclor 1016 on or about October 17, 1976. Between July 27 and October 17, 1976, he may have had such exposure "five or six times" (Tr. pp. 327, 328). During the month following that he may have been exposed to Aroclor 1016 "maybe another half a dozen...a minimum of five or six times." On one occasion about a quart ("no more than a quart") spilled from the ruptured capacitor, but "sometimes...there's not more than a tablespoon or so" (Tr. pp. 335, 336).[12/]

The employee witness saw certain unnamed employees, members of the "cleanup crew," cleaning the spilled fluid from the floor. He did not say, however, that they experienced any skin contact with the offending material.

Complainant's expert witness did not state an informed opinion[13/] on the question before me, viz., whether "there is a substantial probability that death or serious physical harm could result from [the exposure of Respondent's employees to Aroclor 1016 on 10 or 12 occasions during a five or six month period]."[14/] There is no other evidence in the record to support

---

11/ General Electric Company advises against only "continued exposure" (Complainant's Exhibit H). Monsanto Industrial Chemicals Company (the manufacturer of Askarel or Aroclor) cautions against "prolonged or repeated [or] excessive skin contact" (Respondent's Exhibit A).

12/ There was another electrician working with Mr. De Vilbiss on October 17, 1976, and seemingly he too had Aroclor 1016 spilled on him (Tr. pp. 333, 334), but the extent of his exposure (amount of oil or number of times) was not explored.

13/ Indeed, it appears from the record that medical science is not yet well enough informed on the subject to allow such a judgment. Years hence, perhaps the doctor's opinion might be different (and this decision may be too! ).

14/ Section 17(k) of the Act:

> (k) For purposes of this section, a serious violation shall be deemed to exist in a place of employment if there is a substantial probability that death or serious physical harm could result from a condition which exists, or from one or more practices, means, methods, operations, or processes which have been adopted or are in use, in such place of employment unless the employer did not, and could not with the exercise of reasonable diligence, know of the presence of the violation.

such a conclusion. See Secretary of Labor v. Hermitage Concrete Pipe Company, et al., 584 F.2d 127 (6th Cir. 1978).

## FINDINGS OF FACT

A preponderance of the probative evidence of record, taken in its entirety, compels the following findings of fact:

1. Respondent, Kaiser Aluminum and Chemical Corporation, is a corporation which exists by virtue of the laws of the State of Delaware.

2. Respondent employs employees in a business which uses materials and equipment from extra-State sources, and it ships its products in interstate commerce.

3. On October 17, 1976, and on January 12, 1977, Respondent maintained a place of business at Ravenswood, West Virginia, where it employed in excess of 3,000 employees and produced goods valued at $100,000 or more.

4. On or about October 17, 1976, one or more of Respondent's employees at the above-described work site was exposed to the occupational hazard described in Complainant's Citation, dated January 28, 1977.

5. On or about January 12, 1977, Respondent's employees were not exposed to the occupational hazard described in Complainant's Citation, dated January 28, 1977.

6. The exposure of Respondent's employee or employees to the occupational hazard described in Finding of Fact numbered 4 was not such that it posed a substantial probability that death or serious physical harm could result therefrom.

## CONCLUSIONS OF LAW

1. Jurisdiction of the parties and of the subject matter herein is conferred upon the Occupational Safety and Health Review Commission by Section 10(c) of the Act.

2. At all times relevant hereto, Respondent was an employer engaged in a business affecting commerce within the meaning of Section 3(5) of the Act, and as such it was subject to the requirements of Section 5(a)(2) of the Act and of the safety and health standard promulgated by Complainant and codified at 29 CFR 1910.132(a).

3. The safety and health standard codified at 29 CFR 1910.132(a) is not unenforceably vague as applied to the facts involved here.

4. Complainant's Citation was timely issued, as required by Sections 9(a) and 9(c) of the Act.

5. Complainant's Citation is not defective by reason of the fact that his agent did not observe the cited violation.

6. Respondent did not violate the provisions of Section 5(a)(2) of the Act on January 12, 1977, by failing to comply with the requirements of the safety and health standard codified at 29 CFR 1910.132(a), as charged by Complainant in the Citation dated January 28, 1977, and as more fully described hereinabove.

7. Respondent did violate the provisions of Section 5(a)(2) of the Act on October 17, 1976, by its failure to comply with the requirements of the safety and health standard codified at 29 CFR 1910.132(a), as charged by Complainant in the Citation dated January 28, 1977, and as more fully described hereinabove.

8. The violation described in Conclusion of Law numbered 7 was "other-than-serious" in nature.

9. Considering the size of Respondent's business, the gravity of the violation, its good faith, and the history of its previous violations, a penalty of $210, as proposed by Complainant, is appropriate.

## ORDER

Upon consideration of the aforegoing findings and conclusions, it is hereby ORDERED that the Citation issued to Respondent by Complainant on January 28, 1977, (and amended on February 14, 1977, and as further amended on July 29, 1977) is AFFIRMED as to the violation on October 17, 1976, (an "other-than-serious" violation), and VACATED as to the alleged violation on January 12, 1977; and a penalty of $210 is ASSESSED.

DECISION

Before ROWLAND, Chairman; CLEARY and COTTINE, Commissioners.

BY THE COMMISSION:

In this case, Administrative Law Judge Foster Furcolo held that Respondent, Consolidated Rail Corporation ("Conrail"), violated section 5(a)(1)[1/] of the Act by allowing its employees to ground overhead railway high voltage electrical wires without first pretesting the wires to assure they were deenergized. Judge Furcolo also held that Conrail violated 29 C.F.R. § 1910.132(a).[2/] We affirm Judge Furcolo's decision.

---

1/ This case arose under the Occupational Safety and Health Act of 1970, 29 U.S.C. §§ 651-678 ("the Act"). Section 5(a)(1) of the Act, 29 U.S.C. § 654(a)(1), provides:

> Sec. 5.(a) Each employer — (1) shall furnish to each of his employees employment and a place of employment which are free from recognized hazards that are causing or are likely to cause death or serious physical harm to his employees.

2/ 29 C.F.R. § 1910.132(a) provides, in pertinent part,

> Protective equipment, including personal protective equipment for . . . extremities, . . . shall be pro-

(continued on next page)

I

Pursuant to an employee complaint, a compliance officer of the Occupational Safety and Health Administration ("OSHA") inspected Conrail's electrical facilities in Stamford, Connecticut, in November and December, 1977. During his inspection, the compliance officer observed Conrail workers preparing to perform work on 11,000-volt overhead wires. The employees grounded the wires by attaching long wooden poles called "ground sticks" or "shepherd sticks." The employees did not pretest the wires before attaching the ground sticks to see if the wires were still live. The compliance officer feared that grounding the wires without pretesting would expose Conrail employees to burns or electrocution. Therefore, the Secretary cited Conrail for violating section 5(a)(1) of the Act.

The compliance officer also observed that, when the employees attached the ground sticks to the wires, the employees were not wearing protective gloves and that several of the wooden poles in use were worn, in general disrepair, and had shredded insulation. The compliance officer believed this equipment was inadequate for the tasks required. Therefore, the Secretary cited Conrail for violating section 1910.132(a).

II

Before Judge Furcolo, Conrail argued against the two alleged violations on their merits but Conrail also moved to dismiss the citation,

---

2/ (continued)

> vided, used, and maintained in a sanitary and reliable condition wherever it is necessary by reason of hazards of processes or environment . . . encountered in a manner capable of causing injury or impairment. . . .

claiming that OSHA did not have "jurisdiction of the subject matter" of the citation. First, Conrail claimed that OSHA's own electrical standards precluded OSHA jurisdiction. It referred to 29 C.F.R. § 1910.308 (c)(2)(iii),[3/] which states that the OSHA electrical standards will not apply to,

> Installations of railways for generation, transformation, transmission, or distribution of power used exclusively for operation of rolling stock or installations used exclusively for signalling and communication purposes.

Conrail also claimed that a March 14, 1978 policy statement[4/] of the Federal Railway Administration ("FRA") precluded OSHA jurisdiction under section 4(b)(1) of the Act.[5/] In the policy statement, the FRA attempted to delineate the respective jurisdictions of the FRA and OSHA. The policy statement indicates that while OSHA standards apply to working conditions in the railroad industry that are similar to those of any industrial workplace, the FRA regulates health and safety matters directly related to railroad operations, and therefore FRA regulations preclude the applicability of OSHA standards to subjects such as railroad track, roadbed, and associated devices and structures.[6/]

---

3/ Since the inspection and citation in this case, the Secretary has promulgated new electrical standards, 29 C.F.R. §§ 1910.301 - 1910.308. See 46 Fed. Reg. 4056 (1981). The exemption to which Conrail referred, formerly 29 C.F.R. § 1910.308(c)(2)(iii), is now found at 29 C.F.R. § 1910.302(a)(2)(iii). In this decision, we will use the old designation.

4/ See 43 Fed. Reg. 10583-10590 (1978).

5/ Section 4(b)(1), 29 U.S.C. § 653(b)(1), provides in pertinent part,

> Nothing in this chapter shall apply to working conditions of employees with respect to which other Federal agencies . . . exercise statutory authority to prescribe or enforce standards or regulations affecting occupational safety or health.

6/ 43 Fed. Reg. at 10585.

The Secretary argued that neither the language of the electrical standards nor the March 14, 1978 FRA policy statement precluded OSHA authority over the alleged hazards. The Secretary argued that the exclusion at section 1910.308(c)(2)(iii) applies only to specific citations under the OSHA electrical standards. Because Conrail was cited for a section 5(a)(1) violation, the exclusion did not apply. In addition, the section 5(a)(1) citation was proper, according to the Secretary, because there was no specific standard in the OSHA electrical standards for which Conrail could be cited. The Secretary also argued that the FRA policy statement is not a standard or regulation under section 4(b)(1) of the Act, contending that the policy statement is only a general statement of the future intent of the FRA and does not preclude OSHA authority.

III

Judge Furcolo found that neither basis put forward by Conrail precluded the Secretary's authority. The judge stated that section 1910.308(c)(2)(iii) did not apply because,

> In my view, the Respondent's employees were not 'installing' equipment but were maintaining or repairing or operating existing facilities.

Judge Furcolo also noted that the inspection of the Conrail facilities occurred before the March 14, 1978 FRA policy statement. Therefore, the policy statement had no effect on this case. Judge Furcolo went on to conclude that Conrail violated sections 5(a)(1) and 1910.132(a) as alleged.

Conrail petitioned the Commission for review. Commissioner Cottine directed review on all issues raised by the petition including the following questions:

(1) Whether the administrative law judge erred in finding that the Federal Railroad Administration had not exercised its statutory authority to prescribe standards affecting occupational safety and health within the meaning of § 4(b)(1) of the Act, 29 U.S.C. § 653(b)(1), by its policy statement of March 14, 1978, 43 Fed. Reg. 10584.

(2) If the policy statement constitutes an exercise of statutory authority by the Federal Railroad Administration, whether the particular working condition involved in this case is covered by the policy statement.

(3) Whether the administrative law judge erred in finding that the Respondent failed to comply with the occupational safety standard published at 29 C.F.R. § 1910.132(a), and with § 5(a)(1) of the Act, 29 U.S.C. § 654(a)(1).

In its petition, Conrail also reiterated its contention that OSHA jurisdiction was precluded by the language of 29 C.F.R. § 1910.308(c)(2)(iii). On review, the parties make essentially the same arguments they made to the judge.

IV

We agree with Judge Furcolo's conclusion that the policy statement did not preclude OSHA's authority to issue the citation in this case. The inspection was performed and citation was issued several months before the publication of the policy statement. The only FRA action in effect at the time these activities occurred was a notice of proposed rulemaking.[7/] The Commission has held that a notice of proposed rulemaking is not a sufficient exercise of authority under section 4(b)(1)

---

7/ See 41 Fed. Reg. 29153 (1976).

to preempt OSHA authority.[8/] Seaboard Coast Line Railroad Co., 75 OSAHRC 11/E14, 3 BNA OSHC 1767, 1975-76 CCH OSHD ¶ 20,185 (No. 11904, 1975), appeal dismissed, 548 F.2d 1052 (D.C. Cir. 1976).

We also agree with Judge Furcolo's conclusion that section 1910.308(c)(2)(iii) did not preclude the Secretary from issuing the citation, but for different reasons than those given by the judge. Under section 6(a) of the Act, 29 U.S.C. § 655(a), the Secretary was authorized to adopt as occupational safety and health standards established federal standards and national consensus standards. S.Rep. No. 1282, 91st Cong. 2d Sess. 6 (1970), reprinted in Senate Comm. on Labor and Public Welfare, 92d Cong., 1st Sess., Legislative History of the Occupational Safety and Health Act of 1970, at 146 (1971). The two major sources of national consensus standards were the American National Standards Institute and the National Fire Protection Association ("NFPA").

---

8/ The Commission has held that the FRA policy statement preempts OSHA authority over those working conditions in the railroad industry that the FRA states fall within its exclusive jurisdiction. Consolidated Rail Corp., 82 OSAHRC , 10 BNA OSHC 1577, 1982 CCH OSHD ¶ 26,044 (No. 79-1277, 1982), appeal filed, No. 82-3302 (3rd Cir. June 28, 1982). However, in Consolidated Rail Corp., both the citation and the inspection occurred after the effective date of the FRA policy statement. See also Consolidated Rail Corp., 82 OSAHRC , 10 BNA OSHC 1564, 1982 CCH OSHD ¶ 26,046 (No. 78-1504, 1982), appeals filed, Nos. 82-3301 & 82-3305 (3rd Cir. June 28, 1982) (the Secretary lacked authority to issue the citation because the FRA policy statement, which indicated that the FRA had exercised exclusive jurisdiction over the working conditions, became effective before the Secretary issued the citation). In this case, the inspection took place and the citation was issued before the policy statement took effect.

Commissioner Cottine notes that, in his view, the FRA policy statement is not a standard or regulation within the meaning of § 4(b)(1) of the Act and therefore cannot under any circumstances operate to preempt the applicability of OSHA standards to railroad operations. See Consolidated Rail Corp., 81 OSAHRC 8/A2, 9 BNA OSHC 1258, 1981 CCH OSHD ¶ 25,172 (Nos. 78-3100 et al, 1981), appeal filed, No. 81-1210 (1st Cir. Apr. 2, 1981), transferred, No. 81-4192 (2d Cir. Oct. 2, 1981) (OSHRC Docket No. 78-3100) & No. 81-2639 (3d Cir. Oct. 2, 1981) (OSHRC Docket No. 78-4881); see also Consolidated Rail Corp., supra (No. 79-1277) (Cottine, Commissioner, dissenting in part and concurring in part).

Id. Promulgation of additional standards, as well as modification of existing standards, was to be achieved through the rulemaking procedures set forth in section 6(b) of the Act, 29 U.S.C. § 655(b).

Pursuant to section 6(a) authority, the Secretary adopted various national consensus and established federal standards in 29 C.F.R. Part 1910, including the Subpart S electrical standards. 36 Fed.Reg. 10466 (1971). The principal source of the electrical standards was the 1968 National Electrical Code ("NEC" or "Code"). Acting under the two-year authority of section 6(a), the Secretary amended the electrical standards by adopting significant portions of the revised 1971 Code. 37 Fed.Reg. 3431 (1972).

Section 1910.308(a) of the OSHA electrical standards, prior to further amendment on January 16, 1981, see note 3 supra, stated:

> Section 1910.309 adopts as a national consensus standard the National Electrical Code NFPA 70-1971; ANSI C1-1971 (Rev. of C1-1968), which is incorporated by reference in this subpart.

The NEC and the OSHA electrical standards that adopted its provisions were designed to cover electrical installations and utilization equipment installed or used within buildings or other designated premises. 29 C.F.R. § 1910.308(c)(1); NEC § 90-2(a). Section 1910.308(b) stated that the Code's purpose was:

> the practical safeguarding of any persons and of buildings and their contents from hazards arising from the use of electricity for light, heat, power, radio, signaling, and for other purposes.

The NEC § 90-2(b) also specifically excluded certain electrical installations from the scope of the Code, including:

> [i]nstallations of railways for generation, transformation, transmission or distribution of power used exclusively for operation of rolling stock or installations used exclusively for signaling and communication purposes.

NEC § 90-2(b)(3). Section 1910.308(c)(2) of the OSHA standards incorporated verbatim the NEC exclusions. The exclusion was preserved in the new electrical standards. See note 3 supra.

There is no question in this case that the overhead wire which was being grounded by Conrail's employees was used to power the railroad. Therefore, by the terms of the electrical standards, OSHA could not apply the standards in sections 1910.308 and 1910.309 to this electrical installation. However, the OSHA exclusions do not represent a determination by the Secretary that the designated electrical installations should not be regulated at all under the Act. Rather, the exclusions are a recognition that the incorporated national consensus standards were not designed to cover the designated installations.[9/] Thus, the exclusions apply only to the standards contained within the subpart.[10/]

---

9/ In the preamble to the adoption of the revised electrical standards, 46 Fed. Reg. 4034 (1981), the Secretary specifically discussed one of the exclusions, the utility exclusion, formerly set forth at § 1910.308 (c)(2)(v) and recodified at § 1910.302(a)(2)(v). The Secretary stated:

> As stated by witnesses at the hearing, the scope provision of the standard does not grant exemptions. . . . Instead, the "utility exemption," as it is referred to, is simply a statement of installations which were never intended to be within the scope of the NEC, or of this standard. In other words the standard, like the NEC, does not contain provisions which are appropriate for dealing with utility installations. . . .

46 Fed. Reg. at 4038. Similarly, railway installations were not granted an exemption from the Act's enforcement by the scope provision to the electrical standards. They are simply not regulated by the specific standards included within that subpart.

10/ Exclusions contained in a specific standard apply "only to the detailed requirements contained in that section of the regulations." Faultless Div., Bliss & Laughlin Indus., Inc. v. Secretary, 674 F.2d 1177, 1188 (7th Cir. 1982) (emphasis in original).

The Secretary cannot apply the general duty clause to conditions expressly covered by specific standards. Ted Wilkerson, Inc., 81 OSAHRC 70/D8, 9 BNA OSHC 2012, 1981 CCH OSHD ¶ 25,551 (No. 13390, 1981), and cases cited therein. However, recognizing that specific standards could not be promulgated to cover all hazardous conditions, Congress enacted section 5(a)(1):

> The general duty clause in this bill would not be a general substitute for reliance on standards, but would simply enable the Secretary to insure the protection of employees who are working under special circumstances for which no standard has yet been adopted.

S. Rep. No. 1282, 91st Cong., 2d Sess. 10 (1970), reprinted in Senate Comm. on Labor & Public Welfare, 92d Cong., 1st Sess., Legislative History of the Occupational Safety & Health Act of 1970, at 150 (1971). Because the standards in Subpart S-Electrical did not apply to the working conditions involved in this case, the Secretary properly cited Conrail for violations of section 5(a)(1)[11/] and section 1910.132(a).[12/] Accordingly, we turn to the merits of these citations.

---

11/ Commissioner Cleary is satisfied that the context of the "exclusion" in § 1910.308 is such that there is no standard covering railroad installations, and thus it is appropriate to apply § 5(a)(1). He does not regard this case as permitting § 5(a)(1) to be applied in those instances in which a standard covers working conditions but contains an exclusion, and § 5(a)(1) is employed to effectively negate the exclusion. Similarly, he would not countenance the use of § 5(a)(1) where a hazard is addressed by a standard, see Daniel International, Inc., 82 OSAHRC , 10 BNA OSHC 1556, 1982 CCH OSHD ¶ 26,033 (No. 78-4279, 1982), or where a standard comprehensively regulates to the point that the sense of the standard is that no further regulation is intended, cf. Puget Sound Tug & Barge, 81 OSAHRC 50/A2, 9 BNA OSHC 1764, 1782, 1981 CCH OSHD ¶ 25,373 at p. 31,601 (No. 76-4905, 1981) (concurring and dissenting opinion), appeal filed, No. 81-7406 (9th Cir. June 26, 1981).

12/ See American Smelting & Refining Co. v. OSHRC, 501 F.2d 504 (8th Cir. 1974) (section 5(a)(1) was properly cited for excessive employee lead exposure prior to the effective date of the recently promulgated

(Continued on next page)

V

Because Conrail's employees did not test high voltage overhead wires to determine whether they were energized before attaching grounds, the Secretary alleged that Conrail violated section 5(a)(1). Judge Furcolo affirmed the citation. Conrail argues that the industry does not recognize a need to test lines before grounding them and does not use the fiberglass "glow sticks" suggested by the Secretary. Conrail also argues that the glow sticks are not feasible.

To establish a section 5(a)(1) violation, the Secretary must show that the employer failed to render its workplace free from a hazard that is recognized and likely to cause death or serious physical harm to its employees. See Little Beaver Creek Ranches, Inc., No. 77-2096 (June 30, 1982). The Secretary must also demonstrate that there was a feasible means available to abate the hazard. Id.; National Realty and Const. Co. v. OSHRC, 489 F.2d 1257, 1268 (D.C. Cir. 1973).

The recognized hazard under section 5(a)(1) is a condition or practice in the workplace that is harmful and known to be hazardous by either the industry in general or by the employer in particular. Kansas City Power & Light Co., 82 OSAHRC , 10 BNA OSHC 1417, 1982 CCH OSHD

---

12/ (Continued)

lead standard). Also, the Commission and the circuit courts have held that the general machine guarding standard, § 1910.212, is applicable to press brakes notwithstanding the specific exclusion of press brakes from a more specific standard, the mechanical power press guarding standard at § 1910.217. See Faultless Div., Bliss & Laughlin Indus., Inc. v. Secretary, note 10 supra; Diebold, Inc., 76 OSAHRC 3/E5, 3 BNA OSHC 1897, 1975-76 CCH OSHD ¶ 20,333 (Nos. 6767 et al, 1976), rev'd on other grounds, 585 F.2d 1327 (6th Cir. 1978); Irvington Moore, Div. of U.S. Natural Resources, Inc., 75 OSAHRC 45/A2, 3 BNA OSHC 1018, 1974-75 CCH OSHD ¶ 19,523 (No. 3116, 1975), aff'd, 556 F.2d 431 (9th Cir. 1977).

¶ 25,957 (No. 76-5255, 1982); Beaird-Poulan, A Div. of Emerson Electric Co., 79 OSAHRC 21/D11, 7 BNA OSHC 1255, 1979 CCH OSHD ¶ 23,493 (No. 12600, 1979). The Secretary need only show recognition of this hazard, not recognition of the means of abatement. Kansas City Power & Light Co., supra; see Continental Oil Co. v. OSHRC, 630 F.2d 446 (6th Cir. 1980), cert. denied, 101 S.Ct. 1481 (1981); see also General Dynamics Corp., Quincy Shipbuilding Div. v. OSHRC, 599 F.2d 453 (1st Cir. 1979).

The hazard in this case is burns or electrical shock from employee exposure to energized electrical lines during grounding procedures. Judge Furcolo found that Conrail had actual knowledge of this hazard. He relied on evidence showing that supervisory employees knew of flashes of fire several inches to several feet long when employees attached ground sticks to energized lines. Employees had been burned or temporarily blinded as a result. Also, Conrail had a rule requiring testing before working on electrical lines and Conrail had instructed employees to stand upwind and look away when grounding a line. Conrail asserts that the hazard was not recognized but, to a large extent, Conrail focuses not on the hazardous condition or practice of grounding energized lines but on recognition of the abatement method. Conrail argues that the industry did not recognize a hazard from failing to test and did not see a need for glow sticks. However, insofar as Conrail incorrectly defines the hazard in terms of the abatement method, Conrail's arguments are without merit, and a preponderance of the evidence supports the finding that Conrail knew of the hazard. The evidence also shows that an incident was likely to cause death or serious physical harm.

Because employees were grounding electrical lines without first testing to determine if they were energized, the worksite was not free

of the hazard. Also, the record establishes that a feasible means of abatement existed. The Secretary presented evidence that fiberglass glow sticks can warn that a line is energized.[13/] Judge Furcolo found use of these glow sticks infeasible because of Conrail's evidence that the glow sticks are too delicate for use by railroads. However, the record shows that with proper care glow sticks are capable of long term use. In fact, glow sticks are being effectively used by some electric companies. Accordingly, we find that there was a feasible means of abatement. Because all of the elements of a section 5(a)(1) violation are established, we affirm the judge's decision upholding the section 5(a)(1) violation.

Judge Furcolo assessed a penalty of $400 for this violation. Having considered the factors in 29 U.S.C. § 666(j), we conclude that $400 is appropriate for the violation.

VI

Judge Furcolo also affirmed four items charging that Conrail violated section 1910.132(a).[14/] Item 2(a) concerns employee failure to wear rubber gloves while attaching ground sticks. Items 2(d)-(f) concern employee use of ground sticks with defective insulation or frayed grounds. The Secretary alleged that these ground sticks were not properly maintained.

Section 1910.132(a) is a "broadly worded standard that imposes a generalized duty to protect employees by the use of whatever personal protective equipment is necessary by reason of certain hazards, including those of pro-

---

13/ In addition to glow sticks, the record also establishes that volt meters and buzz boxes can be used to warn employees if a conductor is energized.

14/ A fifth item was also affirmed but we reverse the judge's decision and vacate this item, item 2(c), because on review the Secretary moves to withdraw subitem 2(c) due to lack of evidence. We grant the Secretary's unopposed motion to withdraw the citation for that subitem.

cesses or equipment." Owens-Corning Fiberglas Corp., 79 OSAHRC 26/D6, 7 BNA OSHC 1291, 1295, 1979 CCH OSHD ¶ 23,509 at pp. 38,491-92 (No. 76-4990, 1979), aff'd, 659 F.2d 1285 (5th Cir. 1981). Its application depends on "whether a reasonable person familiar with the circumstances surrounding an allegedly hazardous condition, including any facts unique to a particular industry, would recognize a hazard warranting the use of protective equipment." Id.

Conrail's assertion that rubber gloves are not used by the railroad industry is without merit. Although evidence of industry custom and practice is relevant in determining whether a reasonable person would perceive a hazard, it is not dispositive. Id. "Nothing in the OSH Act or its legislative history requires or permits the Secretary to await an industry consensus about unsafe conditions before moving to enforce." Faultless Div., Bliss & Laughlin Indus., Inc. v. Secretary, 674 F.2d at 1187, citing Voegele Co. v. OSHRC, 625 F.2d 1075 (3d Cir. 1980), and Bristol Steel & Iron Works, Inc. v. OSHRC, 601 F.2d 717 (4th Cir. 1979).

The evidence establishes that grounding live wires presented a hazard of electrical shock or burns from flashes of fire. Unrefuted testimony establishes that employees did not wear gloves when grounding the wires and that this practice increased the likelihood of injury. As previously noted, Conrail was aware of the numerous instances when employees had been exposed to these hazards.[15/] Furthermore, the frayed and worn condition of the ground sticks increased the chances of accidental injury against which rubber gloves could provide protection. Accordingly, we affirm the judge's decision affirming item 2(a).

---

15/ See Consolidated Rail Corp., 10 BNA OSHC at 1567 n.8, 1982 CCH OSHD at p. 32,715 n. 8.

Items 2(d)-(f) involve the use of damaged ground sticks. In Pratt & Whitney Aircraft, Div. of United Technologies Corp. 81 OSAHRC 39/A2, 9 BNA OSHC 1653, 1665, 1981 CCH OSHD ¶ 25,359 at p. 31,512 (No. 13401, 1981), appeal withdrawn, No. 81-4104 (2d Cir. Aug. 3, 1981), the Commission concluded that the personal protective equipment requirements of section 1910.132(a) refer to protective objects that may be worn by employees. The Commission found that the standard is not applicable to the absence of asbestos insulation around hot pipes that employees could contact and from which they could receive burns. Pratt & Whitney is controlling in this case. We therefore reverse the judge's decision and vacate items 2(d)-(f).

The judge assessed $150 for the five instances of violation of section 1910.132(a) which he affirmed. We affirm only one of the five instances and we have carefully considered the penalty appropriate for the one violation remaining. Having considered the factors in 29 U.S.C. § 666(j), we assess $50.

VII

Accordingly, we affirm the judge's decision affirming item 1 of citation 1 alleging a violation of section 5(a)(1) and we assess a penalty of $400. We affirm the judge's decision affirming item 2(a) of citation 1 alleging a violation of section 1910.132(a) for failure to wear rubber gloves and we assess a penalty of $50. We reverse the judge's decision affirming items 2(c)-(f) of citation 1 and vacate those items. SO ORDERED.

FOR THE COMMISSION

Ray H. Darling, Jr.

RAY H. DARLING, JR.
EXECUTIVE SECRETARY

DATED: JUL 30 1982

ROWLAND, Chairman, dissenting in part and concurring in part:

I disagree with the majority insofar as it concludes that Conrail violated sections 5(a)(1) and 1910.132(a). Consistent with circuit court and Commission precedent, the exclusion at section 1910.308(c)(2)(iii) for railway power installations cannot be circumvented by resort to section 5(a)(1). Furthermore, the Secretary did not prove that Conrail violated section 1910.132(a) with respect to protective gloves. Accordingly, I would reverse the judge's disposition of items 1a and 2a of citation 1, and vacate the alleged violations.

Section 1910.308(c)(2) specifies express exclusions from the Secretary's electrical standards. 15/ One of the exclusions, section 1910.308(c)(2)(iii), explicitly excepts:

> Installations of railways for generation, transformation, or distribution of power used exclusively for operation of rolling stock or installations used exclusively for signaling and communication purposes.

It is undisputed that Conrail's employees were grounding railway power lines. Therefore, as the majority concedes, the terms of the Secretary's own standards on electrical hazards precluded the Secretary from citing Conrail under the specific electrical standards.

The Secretary argues that since there was no specific section in the electrical standards under which Conrail could be cited, he could cite section 5(a)(1). However, no section in the OSHA electrical standards was applicable to this case because of the exemption. 16/ By charging Conrail with a violation under section 5(a)(1) for

---

15/ Section 1910.308(c)(2) has been recodified as section 1910.302(a)(2). See note 3, infra. I will use the old designation.

16/ The majority suggests that § 1910.308(c)(2)(iii) is an "exclusion" not an "exemption". However, in an analogous case, the Court of Appeals for the Fifth Circuit explained that flat roofs are "exempted" from the requirements of a standard which by its terms applies only to sloped roofs. R.L. Sanders Roofing v. OSHRC, 620 F.2d 97, 99-100 (5th Cir. 1980) (interpreting 29 C.F.R. § 1926.451(u)(3)). I therefore conclude that § 1910.308(c)(2)(iii) is properly characterized as an exemption.

alleged electrical hazards associated with the railway power installations, the Secretary attempted to circumvent his own exception.

An employer is entitled to fair notice of potential liability under the Act. E.g., Diamond Roofing Co. v. OSHRC, 528 F.2d 645, 649 (5th Cir. 1976). Thus, where the Secretary has adopted standards containing a specific exception, the Secretary cannot defeat the exception by applying section 5(a)(1). Southern Ohio Building Systems, Inc. v. OSHRC, 649 F.2d 456 (6th Cir. 1981); R.L. Sanders Roofing v. OSHRC, 620 F.2d 97 (5th Cir. 1980). See Daniel International, Inc., 82 OSAHRC 23/D3, 10 BNA OSHC 1556, 1982 CCH OSHD ¶ 26,033 (No. 78-4279, 1982); John T. Brady & Co., 82 OSAHRC 9/D10, 10 BNA OSHC 1385, 1982 CCH OSHD ¶25,941 (No. 76-2894, 1982); A. Prokosch & Sons Sheet Metal, Inc., 80 OSAHRC 96/A2, 8 BNA OSHC 2077, 1980 CCH OSHD ¶ 24,840 (No. 76-406, 1980). See generally American Luggage Works, Inc., 82 OSAHRC / , 10 BNA OSHC 1678, 1684, 1982 CCH OSHC ¶ 26,072, p. 32,798 (No. 77-893, 1982) (Rowland, dissenting), appeal filed, No. 82-1572 (1st Cir. July 19, 1982). Because the language in section 1910.308(c)(2)(iii) specifically exempts railway installations, fundamental fairness precluded the Secretary from resorting to section 5(a)(1).

The majority nevertheless reasons that because section 1910.308(c)(2)(iii) incorporates verbatim the NEC railway exclusion, the Secretary only intended to acknowledge the scope of the NEC provisions and did not intend to leave railway electrical installations unregulated. The majority's rationale ignores section 1910.308(b), which explains that the purpose of the incorporated NEC provisions is:

> [T]he practical safeguarding of any persons and of buildings and their contents from hazards arising from the use of electricity for light, heat, power, radio, signaling, and for other purposes. The standards contained therein are occupational safety and health standards to the extent that they safeguard any person who is an employee of an employer.

(Emphasis added.) Significantly, this purpose clause was modified from the NEC purpose clause, so as to state that the electrical standards were intended to protect "any . . . employee." The Secretary's statement of purpose in conjunction with

the railway exclusion suggests the Secretary determined that railway installations need not be regulated in order to practically "safeguard any . . . employee." Nor is the preamble to the Secretary's 1981 revision of the electrical standards necessarily indicative of the Secretary's intent at the time he adopted the NEC standards, because the preamble was issued several years after the electrical standards were originally adopted under section 6(a) of the Act. In light of the Secretary's expressed intent to protect "any" employee and in light of the specific exclusion of railway electrical installations, I cannot conclude that Conrail was fairly apprised of its proported liability under section 5(a)(1).

Moreover, the Secretary's and the majority's position is inconsistent with the rulemaking process contemplated by section 6(b) of the Act. See Daniel International, Inc., supra, 10 BNA OSHC 1559, 1982 CCH OSHD at p. 32,683. I note that the Secretary has excercised his section 6(b) authority to promulgate specific electrical standards for communications installations, which were also exempted by the section 1910.308(c)(2) exclusions. See 29 C.F.R. § 1910.268 (telecommunications standards); 40 Fed. Reg. 13,436 (telecommunications standards promulgated under § 6(b) of the Act). This indicates that the Secretary himself has recognized that he must promulgate specific standards if he wishes to cover the excepted installations. 17/ Since Conrail was exempt from liability by the language of section 1910.308(c)(2)(iii), I would vacate the section 5(a)(1) charge as alleged in citation 1, item 1a.

Nor did the Secretary prove a violation of section 1910.132(a), concerning rubber gloves to protect the employees from an alleged "possibility of electrical shock." As the majority notes, Commission precedent holds that a section 1910.132(a) violation cannot be upheld unless the Secretary shows that "a reasonable person

---

17/ Because the inspection and citations occurred prior to the FRA policy statement, I do not address the issue of whether the FRA policy statement would preempt, under section 4(b)(1), any future efforts by OSHA to regulate railway power installations with specific standards. See note 8, infra.

familiar with the circumstances surrounding an allegedly hazardous condition, including any facts unique to a particular industry, would recognize a hazard warranting the use of protective equipment." Owens-Corning Fiberglas Corp., 79 OSAHRC 26/D6, 7 BNA OSHC 1291, 1979 CCH OSHD ¶ 23,509 (No. 76-4990, 1979) (reasonable person), aff'd, 659 F.2d 1285 (5th Cir. 1981) (industry custom or actual knowledge). 18/

The record is devoid of any evidence suggesting that employees in the railway industry customarily use rubber gloves to supplement the insulating properties of the wooden poles when grounding power lines. To the contrary, Mr. Mayer, a Conrail supervisor with over thirty years experience in the railway industry, testified without rebuttal that he has never seen rubber gloves used in conjunction with wooden ground sticks.

The majority concludes that this evidence of industry custom is not dispositive. In the majority's view, Conrail was actually aware of the "numerous instances" of employee exposure to electrical shock warranting the use of rubber gloves. 19/ I disagree.

The record shows that the employees were in no danger of electrical shock as long as the wooden ground sticks retained their insulating properties. Although

---

18/ I need not decide whether the majority's reasonable person test or the Fifth Circuit's industry custom/actual knowledge test is more appropriate, because under either test, a section 1910.132(a) violation cannot be sustained when, as here, the only reliable evidence shows that the industry does not customarily use personal protective equipment.

19/ The majority also suggests that Conrail's alleged awareness of burns shows that Conrail perceived the need for rubber gloves. But, the OSHA compliance officer contended that rubber gloves would protect against the "possibility of electrical shock or electrocution," not burns.

the compliance officer criticized the way Conrail handled and maintained the sticks, there is no evidence that the insulating capacity of the sticks was adversely affected. Significantly, none of the employees testified that they had been shocked when attaching the wooden ground sticks. Since the only probative evidence shows that the railway industry does not customarily use protective gloves when grounding power lines with wooden shepherd sticks, the Secretary has not established the violation of section 1910.132(a) alleged in item 2a, citation 1. Therefore, I would reverse the judge's decision.

|---|---|
| SECRETARY OF LABOR,<br>Complainant<br>v.<br>CONSOLIDATED RAIL CORPORATION,<br>Respondent | OSHRC DOCKET NO. 78-238 |

Appearances:

John Casler, Esq., for Complainant

William P. Jones, Esq., for Respondent

[Michael Broderick, the union's International Representative (IBEW) appeared as a party "in order to get a copy of whatever transpired" at the hearing...Tr. 88]

DECISION AND ORDER

FURCOLO, Judge:

This case arose under 29 USC, sec. 651 et seq. of the Occupational Safety and Health Act of 1970 (the Act). As a result of an inspection of the Respondent's premises on November 15 - December 2, 1977, Citation #1 issued on or about December 22, 1977, charging in items 1(a) and 2 that the Respondent seriously violated sec. 5(a)(1) of the Act and the standard at 29 CFR 1910.132(a). The Respondent was also charged in items 1(b), (c) and 3 of Citation #1 with the serious violation of sec. 5(a)(1) of the Act; and in items 1 and 2 of Citation #2 with the other than serious violation

of the Act by noncompliance with the standards at 29 CFR 1903.2(a)(1) and 1910.151(b), respectively.

On January 11, 1978, the Respondent filed Notice of Contest to all said items of Citations #1 and 2 and the penalties proposed therefor.

The pertinent sections of the Act and the standards are appended to this decision under appropriate titles.

Transcript page references are to the October hearing except where March hearing is indicated.

## Issues

1. Was there a lack of jurisdiction? [Sec. 4(b) of the Act]

2. Were high voltage conductors tested for voltage before grounds were attached? [Sec. 5(a)(1) of the Act]

3. Were employees using proper protective equipment? [1910.132(a)]

4. Were the wooden "sticks" that were being used a proper method of grounding? [1910.132(a)]

## Stipulations and Admissions

It was stipulated that the penalty proposed for item 1(a) is $400; and that decision on the jurisdictional sec. 4(b)(1) defense would be reserved until briefs were filed...Tr. 6, 12-15, 115.

As a result of the stipulations described in Exh. C-1, the Respondent withdrew its Notice of Contest to items 1(b), (c), and 3 of Citation #1, and items 1 and 2 of Citation #2; and the Complainant amended the proposed penalties for Citation #1 to $150 each for items 1(b) and 1(c), and $100 for item 3; and for Citation #2, no penalty for item 1 and $135 for item 2...Tr. 4-6 and Exh. C-1.

By paragraph 3 of its Answer, the Respondent admitted that its employees work on goods that have moved across state lines.

Preliminary Facts

In the course of operating its railroad, crews of the Respondent's employees worked on high voltage electrical lines and conductors at various places on "the New Haven Line" between New Haven, Conn., and New York, New York. Some of the work involved grounding electrical equipment carrying electric power of over 10,000 volts. In the instant case, the method of installing grounds was by using insulating wooden "sticks", often referred to as "shepherds" because they were poles about 7 - 8 feet long with a U-shaped hook at the end and a ground wire attached to the hook. One end of the ground wire would be attached to a good ground and, using the "stick", the other end would be attached to the overhead wire. The "stick" was often made more secure by tying sashboard or clothesline cable or a similar attachment to the hook... Tr. 26, 30, 31, 49, 58 and Exh. C-4. The fiber glass type of insulating "stick" (preferred by the Complainant's witnesses Normand and Edwards) had a clamp (instead of a hook) on the end to be screwed onto the wire by turning the "stick"...Tr. 52, 53.

Knowledge and "Recognized Hazard"

After the hearing on October 20, 1978, the parties were notified the hearing would be re-opened if either party wished to be heard on a contemplated taking of official notice concerning "recognized hazard". On the Respondent's request, such a hearing was held on March 9, 1979, limited to the following question:

"Is it recognized in the railroad industry that it is a hazard likely to cause death or serious physical harm to employees if conductors of 11,000 volts are not pre-tested before grounds are attached?"

At the March 9th hearing, the Respondent's witnesses testified that there was, no such "recognized hazard" in the railroad industry... Tr. 16-18, 29, 30, 38, 46-49. The Complainant's witnesses testified to individual incidents concerning the attaching of grounds before pre-testing such conductors but they presented no testimony bearing on "recognized hazard" ...Tr. 58, 59, 62. All the witnesses for both the Complainant and the Respondent were honest and well-qualified in their positions. In that situation, where the Complainant's witnesses did not contradict the very positive opinions of the Respondent's witnesses, I find that it is not recognized in the railroad industry that it is a hazard likely to cause death or serious physical harm to employees if conductors of 11,000 volts are not pre-tested before grounds are attached.

However, if supervisory personnel of the Respondent knew that such a practice was hazardous to employees, that would constitute a violation even if it were not a "recognized hazard in the railroad industry". [See Brennan v. OSHRC and Vy Lactos, 494 F(2) 460]

Accidents

The presence or absence of injuries may have some bearing on whether conditions are hazardous. As far as the gloves allegations are concerned, the evidence showed one injury in 34 years. As far as the "sticks" allegations are concerned, the evidence showed two injuries in 36 years: one involving a wooden "stick" and one a fiber

glass type...Tr. 63-67, 92, 110-112. The record of injuries tends to corroborate the Respondent's contention that its practices were not hazardous. However, the presence or absence of injuries is not conclusive.

Sec. 5(a)(1) of the Act [Items 1-3 of Citation #1]

Joseph P. Normand, a well-qualified Compliance Officer, testified that he saw employees of the Respondent attach ground wires to lines carrying 11,000 volts without first checking to be sure the lines had been de-energized...Tr. 7-11, 18-25, 31, 79 and Exh. C-2, 3, 10. His testimony was not contradicted by anyone. The hazard was severe burns or electrocution...Tr. 20, 44, 79.

Supervisory personnel of the Respondent were familiar with the need for testing; had observed employees putting shepherd sticks on "hot" wires; knew of accidents that had occurred in this type of situation; knew of problems along the line involving vandalism, weather conditions, and maintenance of equipment; and had worked with crews of employees. In addition, the Respondent had rules that required such testing...Tr. 19, 25, 44, 64, 92-97, 102-107, 110, 111. All those factors indicate the Respondent's knowledge of the hazardous condition.

As concerns item 1(a), I find that the failure to test was a hazard likely to cause death or serious harm from burns or electrical shock; and the Respondent violated sec. 5(a)(1) of the Act.

As concerns items 1(b) and (c), the Respondent withdrew its Notice of Contest; and those items and the assessment proposed became final orders by virtue of sec. 10(a) of the Act.

29 CFR 1910.132(a) [Items 2(a)-(f) of Citation #1]

The allegations of improper protective equipment concerned rubber gloves and the wooden "sticks". Supervisory personnel of the Respondent knew of the conditions and practices pertaining to "sticks" and gloves...Tr. 19, 20, 25, 44, 97-101, 105.

Compliance Officer Normand testified that he saw employees without gloves attaching grounds to high voltage wires...Tr. 11, 26, 31, 68 and Exh. C-2. That testimony was not contradicted by anyone. The hazard was death or serious harm from burns or electrical shock...Tr. 27, 35, 45, 69. I find that the Respondent was not in compliance with the standard at 29 CFR 1910.132(a) as alleged in item 2(a) of Citation #1.

As far as item 2(b) of Citation #1 is concerned, although the Complainant established that the rubber gloves were rated for only 10,000 volts, there was nothing to indicate that they were to be used for higher voltage wires...Tr. 29, 100, Exh. C-11. The Compliance Officer agreed that employees "never grab directly an 11,000 volt piece of apparatus". He did say that..."there are other areas where gloves would be required"; however, he did not describe any such areas...Tr. 29, 57. Since the Complainant has the burden of proof, in this state of the evidence I find that the violation alleged in 2(b) has not been proven.

As concerns items 2(c)-(f) of Citation #1, the Complainant's evidence tended to establish that the wooden "sticks" being used were improper for various reasons: they were not as safe as other types or they were in disrepair or they had not been certified for 75,000 volts... Tr. 27-30, 37-41, 97, 100 and Exh. C-4-8. [No significant reason for the 75,000 volts testimony was advanced.]

Compliance Officer Normand testified that wooden "sticks" were outmoded and should have been replaced by fiber glass "sticks" with a glow filament or a "buzz box" that warned if a line were energized. The Complainant's extremely well-qualified expert witness, Wallace R. Edwards, agreed with him...Tr. 71-76, 80. Normand also described some of the "sticks" as being old, water-soaked, without protective coating, kept in bad weather too long, and having been subjected to hard wear...Tr. 27-30, Exh. C-4-8. He said that in some instances insulation, wires, clamps, and other attachments to the "sticks" were broken, frayed, corroded, crumbling, and otherwise in unsafe condition ...Tr. 37-41, Exh. C-7, 8.

The Respondent contended that "sticks" had to be outdoors in all kinds of weather, were subjected to rough use, and should have facility of connection. The Respondent's engineer for electric traction, Robert W. Walker, said that wooden "sticks" were better than fiber glass for such conditions...Tr. 99-102, 105-107. And the Complainant's expert acknowledgedthat fiber glass "sticks" were "delicate"...Tr. 83, 86. On the question of the condition of the equipment, Walker said that the "sticks" and their attachments were not warped, frayed, unvarnished or otherwise in an unsafe condition; and that weatherbeaten wooden "sticks" would bear up under 50,000 volts...Tr. 97.

The hazard (whether the "stick" is wooden or fiber glass) was sustaining serious or fatal harm from burns or electrical shock. In fact, the only described injury involving a "stick" was incurred by an employee using the fiber glass type...Tr. 65, 70.

Having in mind the uncontradicted testimony that "sticks" must undergo rough use and that, as compared to the wooden, the fiber glass type is "delicate," I find that the Complainant has not sustained the burden of proving that the wooden "stick" is inadequate. The evidence clearly established that both types are subject to comparable hazards if not used properly and kept in good condition... Tr. 56. That being so, and the record of injuries involving "sticks" being at least as favorable for the wooden as the fiber glass, I find that the Respondent's use of properly maintained wooden "sticks" has not been proven to be non-compliance with the standard at 29 CFR 1910.132(a).

However, the testimony of Compliance Officer Normand pointed out that the wooden "sticks" were not maintained in proper condition. I find that some wooden "sticks" or their attachments were so broken or corroded or damaged that they were unsafe. For that reason, I find that the Complainant has proven the Respondent was not in compliance with the standard at 29 CFR 1910.132(a) as alleged in items 2(c)-(f) of Citation #1.

Section 4(b)(1)

In seeking to sustain its burden of proving that there was a lack of jurisdiction because the Federal Railroad Administration [FRA] had exercised its authority over it, the Respondent relied primarily on the standard at 29 CFR 1910.308(c)(2) and the FRA's Policy Statement that appeared in the Federal Register, volume 43, number 50 [Respondent's Post Trial Brief, pg. 4-8].

The standard at 29 CFR 1910.308(c)(2) expressly states that the provisions of that subpart "...do not cover:...(iii) Installations of railways for generation, transformation, or distribution of power used exclusively for operation of rolling stocks..."

The parties differ in their interpretation of the standard at 29 CFR 1910.308(c)(2). In my view, the Respondent's employees were not "installing" equipment but were maintaining or repairing or operating existing facilities. However, whatever may be the proper construction of the word "installations", that standard was not an exercise of authority by the FRA but was a promulgation of other agencies of government, such as the Department of Labor or the Congress. The standard at 29 CFR 1910.308(c)(2) may have some bearing on the merits of whether there was a violation but, whatever the interpretation of its words, the jurisdictional defense of section 4(b)(1) is not established by it.

The Respondent is not helped by the FRA Policy Statement. That statement was apparently not issued until March of 1978 and the alleged violation occurred several months earlier. Even if it were an exercise of FRA authority, it would have come too late to confer jurisdiction in the instant case.

In any event, the FRA Policy Statement is not a rule or regulation or standard of any kind but is merely a narration of FRA "policy". The statement in it that "... FRA will not hesitate to adopt its own standards to assure a safe environment for railroad operations..." certainly does not qualify as an "exercise" of statutory authority to prescribe or enforce standards or regulations affecting occupational safety or health under section 4(b)(1) of the Act.

The FRA Policy Statement also says: "FRA has now exercised its

statutory authority...by actual rulemaking." However, no illustrations are given of how and why it has so "exercised" its statutory authority.

I find that the Respondent has not sustained the burden of proving its section 4(b)(1) jurisdictional defense. The Respondent's motion to dismiss is denied.

## Findings of Fact

Having heard the testimony, observed the witnesses, and examined the exhibits, the following Findings of Fact are made:

1. At all times concerned, the Respondent regularly received, handled or worked with goods which had moved across state lines.

2. The Respondent withdrew its Notice of Contest to items 1(b), 1(c), and 3 of Citation #1; and items 1 and 2 of Citation #2.

3. As concerns item 1(a) of Citation #1, the hazard of severe burns or electrocution from failure to test high voltage conductors before attaching grounds was not a "recognized hazard within the railroad industry"; and the Respondent's employees attached ground wires to lines carrying 11,000 volts without first testing the lines.

4. As concerns item 2(a) of Citation #1, the Respondent's employees without gloves attached grounds to wires carrying 11,000 volts.

5. As concerns item 2(b) of Citation #1, the rubber gloves were rated for 10,000 volts; and there was no evidence to show they were used for lines carrying higher voltage.

6. As concerns items 2(c)-(f) of Citation #1, some wooden "sticks" were in disrepair or had not been certified for 75,000 volts.

7. The Complainant did not prove that properly maintained wooden "sticks" were not as safe as other feasible methods.

8. The conditions described in items 2(a), (c)-(f) of Citation

#2 exposed the Respondent's employees to sustaining harm because of the hazard of electric shock.

9. The conditions described in item 1(a) of Citation #1 exposed the Respondent's employees to sustaining serious or fatal harm because of the hazard of electric shock.

10. One or more officers or supervisory personnel of the Respondent knew of the hazardous conditions described herein and knew that employees were exposed to such hazards.

11. The Respondent's employees were not "installing" equipment but were maintaining or repairing or operating existing facilities.

12. The Federal Railroad Administration had not prescribed or enforced any standards or regulations affecting occupational safety or health, and had not exercised its authority in any way that would deprive the Occupational Safety and Health Review Commission of jurisdiction to hear and decide the citation and complaint in the instant case.

## Conclusions of Law

1. At all times concerned, the Respondent was an employer engaged in a business affecting commerce within the meaning of the Act; and the Occupational Safety & Health Review Commission has jurisdiction over the subject matter and the parties.

2. At all times concerned, the Respondent knew, or with the exercise of due diligence should have known, of the alleged violations.

3. As concerns items 1(a)-(c) and 3 of Citation #1, the Complainant has sustained the burden of proving the Respondent violated sec. 5(a)(1) of the Act; and, not being in compliance with the standard at

29 CFR 1910.178(p)(1), violated sec. 5(a)(2) of the Act [sec. 654].

4. As concerns items 2(a), (c)-(f) of Citation #1, the Respondent was not in compliance with the standard at 29 CFR 1910.132(a). The Complainant has sustained the burden of proving the Respondent violated sections 5(a)(1) and 5(a)(2) of the Act [sec. 654].

5. The Complainant has not sustained the burden of proving the Respondent was not in compliance with the standard at 29 CFR 1910.132(a) insofar as the allegations of item 2(b) of Citation #1 are concerned.

6. On the dates in question, the Respondent was not in compliance with the standards at 29 CFR 1903.2(a)(1) and 1910.151(b) [respectively items 1 and 2 of Citation #2]; and the Complainant has sustained the burden of proving the Respondent violated section 5(a)(2) of the Act [sec. 654].

## Order

The whole record having been considered, and due consideration having been given to 29 U.S.C., sec. 666(j), it is ordered:

1. Items 1(a)-(c) of Citation #1 are affirmed; penalties of $400 for item 1(a), $150 for 1(b), and $150 for 1(c) are assessed.

2. Item 2 of Citation #1 is affirmed as to paragraphs (a), (c)-(f); and a penalty of $150 assessed therefor.

3. Item 3 of Citation #1 is affirmed and a penalty of $100 assessed therefor.

4. Items 1 and 2 of Citation #2 are affirmed and a penalty of $135 assessed for item 2.

5. Item 2 (b) of Citation #1 is vacated.

6. Whether the Respondent uses "sticks" of wood, fiber glass, or other material, it is ordered to maintain such "sticks" in good condition.

SO ORDERED.

Foster Furcolo

## APPENDIX

### The Act

**Section 653** [section 4(b)(1)] "Nothing in this Act shall apply to working conditions of employees with respect to which other Federal agencies...exercise statutory authority to prescribe or enforce standards or regulations affecting occupational safety or health."

**Section 654** [section 5(a)(1)] Employer "...shall furnish...a place of employment...free from recognized hazards... likely to cause death or serious physical harm to his employees;..."

**Section 654** [section 5(a)(2)] Employer "...shall comply with occupational safety and health standards..."

**Section 659** [section 10(a)] If a Notice of Contest is withdrawn, "the citation and assessment...shall be deemed a final order of the Commission..."

**Section 666** [section 17(b)] "...employer who has received a citation for a serious violation...of this Act...shall be assessed a civil penalty of up to $1,000 for each such violation."

**Section 666** [section 17(j)] "...assess all civil penalties...giving due consideration to...the size of the business... gravity of the violation, the good faith of the employer, and the history of previous violations."

**Section 666** [section 17(k)] "...a serious violation shall be deemed to exist...if there is a substantial probability that death or serious physical harm could result... unless the employer did not, and could not...know of the presence of the violation."

### The Standards

29 CFR 1910.132(a): "Protective equipment...shall be provided, used, and maintained in a sanitary and reliable condition wherever it is necessary..."

29 CFR 1910.308(c)(2): "Not covered. The provisions of this subpart do not cover: ...(iii) Installations of railways for generation, transformation, transmission, or distribution of power used exclusively for operation of rolling stock or installations used exclusively for signaling and communication purposes..."

DECISION

Before ROWLAND, Chairman; CLEARY and COTTINE, Commissioners.

BY THE COMMISSION:

A decision of Administrative Law Judge Foster Furcolo is before the Commission pursuant to section 12(j), 29 U.S.C. § 661(i), of the Occupational Safety and Health Act of 1970, 29 U.S.C. §§ 651-678 ("the Act"). In his decision, Judge Furcolo found that the Respondent, Consolidated Rail Corporation ("Conrail"), had violated section 5(a)(2) of the Act, 29 U.S.C. § 654(a)(2), by failing to comply with several safety and health staudards. Conrail petitioned for review of the judge's decision, and Commissioner Cottine and former Commissioner Barnako directed review of the issues raised in Conrail's petition. We affirm Judge Furcolo's decision.

I

A

On April 25, 1978, a compliance officer of the Occupational Safety and Health Administration ("OSHA") conducted an inspection of Conrail's

diesel facility in Selkirk, New York. During the inspection, the compliance officer observed a Conrail employee in the diesel engine shop performing maintenance work on a diesel locomotive engine. The engine was running and the employee was not wearing any hearing protection. The compliance officer determined, and Conrail does not dispute, that the employee was exposed to approximately twice the allowable noise under 29 C.F.R. § 1910.95(a).[1/] Also, the employee testified that he had experienced hearing loss and headaches. The employee had asked Conrail for some hearing protection during the several months preceding the inspection but Conrail had not provided him with the protection. The Secretary charged Conrail with failure to comply with the occupational noise exposure standard at 29 C.F.R. § 1910.95(a) by not providing the employee with personal protective equipment.[2/] The violation was alleged to be serious in nature.

---

1/ 29 C.F.R. § 1910.95(a) provides in pertinent part:

> § 1910.95 Occupational noise exposure.
>
> (a) Protection against the effects of noise exposure shall be provided when the sound levels exceed those shown in Table G-16. . . .

Table G-16 prescribes the number of hours an employee may be exposed to particular noise levels.

2/ Pursuant to 29 C.F.R. § 1910.95(b)(1), employers must use feasible engineering or administrative controls to protect their employees against excessive noise. Only if such controls are not sufficient to achieve full compliance with the levels of Table G-16 may personal protective equipment be used as a permanent means of protection. See Samson Paper Bag Co., 80 OSAHRC 60/A2, 8 BNA OSHC 1515, 1980 CCH OSHD ¶ 24,555 (No. 76-222, 1980). In this case, however, the Secretary does not allege that Conrail failed to implement feasible engineering or administrative controls. His allegation that Conrail violated § 1910.95(a) is based solely on Conrail's failure to provide personal protective equipment to the employee.

B

At the hearing, Conrail stipulated that its employee was exposed to noise in excess of that permitted by OSHA's occupational noise exposure standard and that, if the standard applied to the cited working condition, it violated the standard. The parties also stipulated that if a violation was found, a $300 penalty would be appropriate. However, Conrail argued that OSHA authority over that working condition had been preempted under section 4(b)(1) of the Act[3/] because the Environmental Protection Agency ("EPA") and the Department of Transportation ("DOT"), through the Federal Railroad Administration ("FRA"), had exercised statutory authority to regulate noise from locomotives under the Noise Control Act of 1972, 42 U.S.C. §§ 4901-18 ("Noise Control Act"). Conrail relied on Railroad Noise Emission Standards promulgated by the EPA and published at 40 C.F.R. Part 201, particularly a standard at 40 C.F.R. § 201.11 establishing a noise emission standard for locomotives operating under stationary conditions. Conrail further relied on FRA regulations, published at 49 C.F.R. Part 210, prescribing the means of compliance with the EPA standards.

The Secretary argued that OSHA's authority was not preempted because the EPA and FRA regulations on which Conrail relied were not intended to protect the health of railroad workers. The Secretary contended that a section 4(b)(1) exemption only arises when regulations of another

---

3/ Section 4(b)(1), 29 U.S.C. § 653(b)(1), provides in pertinent part:

> Nothing in this chapter shall apply to working conditions of employees with respect to which other Federal agencies . . . exercise statutory authority to prescribe or enforce standards or regulations affecting occupational safety or health.

agency have as a policy or purpose the protection of employees. Judge Furcolo agreed with the Secretary's reasoning and found that Conrail had violated section 1910.95(a).

On review, the parties make the same arguments they made before the judge. We conclude that Judge Furcolo properly concluded that the cited working condition was not exempt from the Act.

C

Two questions are relevant in any section 4(b)(1) case: (1) does an agency other than OSHA have the statutory authority to regulate the working conditions affecting the health and safety of certain workers, and (2) has the other agency exercised its statutory authority in such a manner as to exempt the cited working condition from the Act. Northwest Airlines, Inc., 80 OSAHRC 87/B5, 8 BNA OSHC 1982, 1980 CCH OSHD ¶ 24,751 (No. 13649, 1980), appeals dismissed, Nos. 80-4218 and 80-4222 (2d Cir. Feb. 18 and March 31, 1981).

In order to give rise to a section 4(b)(1) exemption, a statute need not be directed exclusively at the safety and health of employees. It is sufficient if the statute is directed at the protection of public safety and health, and employees directly receive the protection the statute is intended to provide. Northwest Airlines, Inc., 8 BNA OSHC at 1987, 1980 CCH OSHD at p. 30,485; Texas Eastern Transmission Corp., 75 OSAHRC 88/D9, 3 BNA OSHC 1601, 1975-76 CCH OSHD ¶ 20,092 (No. 4091, 1975).

The Noise Control Act is this type of statute. In enacting the Noise Control Act, Congress was concerned with the adverse impact of excessive noise on the general public. In a section of the statute entitled "Congressional findings and statement of policy," Congress stated:

> (1) that inadequately controlled noise presents a growing danger to the health and welfare of the Nation's population, particularly in urban areas;
>
> (2) that the major sources of noise include transportation vehicles and equipment, machinery, appliances, and other products in commerce; and
>
> (3) that, while primary responsibility for control of noise rests with State and local governments, Federal action is essential to deal with major noise sources in commerce control of which require national uniformity of treatment.
>
> (b) The Congress declares that it is the policy of the United States to promote an environment for all Americans free from noise that jeopardizes their health or welfare. To that end, it is the purpose of this chapter to establish a means for effective coordination of Federal research and activities in noise control, to authorize the establishment of Federal noise emission standards for products distributed in commerce, and to provide information to the public respecting the noise emission and noise reduction characteristics of such products.

42 U.S.C. § 4901.

The legislative history of the Noise Control Act demonstrates that Congress was concerned with the effects of excessive noise on workers as well as other members of the public. In discussing the adverse effects of noise, the Senate Public Works Committee stated:

> The individual's perception of this process belies its true impact on the delicate mechanism of hearing. Whether the individual is an industrial worker or a member of a hard-rock band, hearing ability following temporary hearing loss due to noise exposure, seemingly returns to normal after a day or so of rest, suggesting to the unwary victim that no permanent damage was incurred.

S. Rep. No. 92-1160, 92 Cong., 2d Sess. (1972), reprinted in 3 U.S. Code Cong. and Adm. News (1972) at p. 4656. The Committee also expressed concern that, "[o]ne study of workers showed men working in noisy conditions to be more aggressive, distrustful and even paranoiac than similar workers in a quieter setting." Id. at 4656-57. In sum, these references

demonstrate that Congress intended workers to be within the class of persons the statute would benefit.

In order to implement the Noise Control Act, Congress authorized the EPA to establish noise emission standards for a variety of sources, including products distributed in commerce,[4] aircraft,[5] and railroad equipment.[6] With regard to railroad operations, the Secretary of Transportation was authorized to promulgate and enforce regulations to insure compliance with the EPA's noise emissions standards.[7] The EPA and FRA rules on which Conrail relies were promulgated pursuant to this authority. We conclude, however, that those rules do not regulate the working condition for which Conrail has been cited in this case and therefore do not exempt that working condition from the operation of the Occupational Safety and Health Act.

The standards that EPA is authorized to promulgate with respect to railroad operations are solely emission standards for equipment. Cf. Adamo Wrecking Co. v. United States, 434 U.S. 275 (1978) (EPA cannot regulate work practices under statutory authority authorizing it to establish emission standards). DOT is empowered to prescribe the manner in which employers in the railroad industry must comply with the EPA emission standards, and if any regulation of working conditions occurs under the Noise Control Act it must result from the FRA regulations promulgated pursuant to the authority granted DOT.

4/ 42 U.S.C. § 4905.

5/ 42 U.S.C. § 4906.

6/ 42 U.S.C. § 4916(a).

7/ 42 U.S.C. § 4916(b).

II

Both Commissioners Cleary and Cottine agree that the EPA and FRA regulations, in combination, limit the noise that railroad equipment may generate. The legislative history of the FRA regulations indicates that the FRA did not intend its regulations to protect employees under circumstances like those present in this case. As the FRA stated in the preamble to the promulgation of the regulations at 49 C.F.R. Part 210:

> One commenter criticized the EPA standards themselves, stating that they are too high to protect employees from noise related injury. The commenter also stated that there are many sources of railroad noise that might affect an employee's health that are not covered by the EPA standards. The commenters requested that FRA promulgate noise emission standards to protect employees.
>
> The commenter's request is not within the scope of this proceeding. Further related rulemaking could be undertaken in the future, depending upon the nature of any evidence that particular noise emissions are a serious safety problem.

42 Fed. Reg. 42343, 42349 (1977).

A

Commissioner Cleary would note that the Secretary seeks to require Conrail to protect its employee against excessive noise by use of personal protective equipment, not to reduce the noise produced by its locomotives. Since the EPA and FRA regulations only govern the noise emitted by Conrail's locomotives and do not address the question of personal protective equipment, the working condition covered by the citation is not governed by the EPA and FRA regulations and OSHA retains jurisdiction in this case.

Conrail also relies on a policy statement issued by the FRA on March 14, 1978 as demonstrating the FRA's exercise of jurisdiction over the cited working condition. Conrail cites the portion of the policy

statement that provides:

> Second, FRA views the question of occupational noise exposure of employees engaged in railroad operations, during their involvement in such operations, as a matter comprehended by the regulatory fields over which FRA has exercised its statutory jurisdiction. FRA is therefore responsible for determining what exposure levels are permissible, what further regulatory steps may be necessary in this area, if any, and what remedial measures are feasible when evaluated in the light of overall safety considerations. FRA's exercise of jurisdiction in this area is evidenced, in part, by the issuance of noise compliance regulations (42 FR 42343; August 23, 1977, issuing 49 C.F.R. Part 210) which will be utilized by FRA to enforce the Evironmental Protection Agency (EPA) Railroad Noise Emission Standards (40 C.F.R. Part 201). . . .
>
> * * *
>
> As suggested above, maximum permissible noise emission levels for rail equipment have already been determined by EPA in consultation with FRA. These emission levels, measured as set forth in the EPA standards, should be recognized by OSHA as establishing the parameters of "feasible administrative or engineering controls" with respect to rail equipment, including locomotives, when such equipment is situated in a railroad shop or enginehouse. . . .

43 Fed. Reg. 10583, 10588 (1978).

Commissioner Cleary notes that the Commission has held that section 4(b)(1) of the Act precludes the Secretary from applying his standards to the working conditions which the FRA policy statement says fall within the FRA's exclusive jurisdiction. Consolidated Rail Corp., 82 OSAHRC , 10 BNA OSHC 1577, 1982 CCH OSHD ¶ 26,044 (No. 79-1277, 1982), appeal filed, No. 82-3302 (3d Cir. June 28, 1982). He does not, however, believe that is the situation in this case. The FRA policy statement does not totally preclude OSHA from enforcing its noise standard in railroad operations. In addition to the portion relied on by Conrail, the policy statement provides:

> Any review of further remedial measures in the area of occupational noise exposure in locomotive cabs and cabooses must take into account the need to preserve the alertness of employees to rail transportation hazards affecting the employees, passengers and the general public along the right-of-way. Only the primary regulatory agency in the area of railroad safety is equipped to evaluate these considerations and to fashion appropriate solutions. The same considerations apply to employees' exposure to retarder noise and other noise emanating primarily from railroad operations.
>
> * * *
>
> However, FRA believes noise exposure in shop areas and other areas where there are multiple noise sources is a qualitatively different issue, since abatement options will be more varied and noise sources will often include power tools and other industrial implements. Therefore, FRA recognizes the applicability of OSHA standards in shop areas, offices and other settings in which "industrial" noise emissions predominate or where exposure may be limited without the potential disruption of safe transportation activities.
>
> As suggested above, maximum permissible noise emission levels for rail equipment have already been determined by EPA in consultation with FRA. These emission levels, measured as set forth in the EPA standards, should be recognized by OSHA as establishing the parameters of "feasible administrative or engineering controls" with respect to rail equipment, including locomotives, when such equipment is situated in a railroad shop or enginehouse. See 29 C.F.R. § 1910.95(b)(1). FRA will work with OSHA to evaluate the prudence of requiring personal protective equipment to reduce noise exposure in those settings where employees may be subjected to more serious hazards associated with railroad operations.

43 Fed. Reg. at 10588.

Read in its entirety, Commissioner Cleary interprets the policy statement (1) to preclude OSHA from requiring engineering controls on locomotives and other rail equipment for which emission standards have been set by the EPA in consultation with FRA; (2) to preclude OSHA from requiring any remedial measures, including the use of personal protec-

tive equipment, in locomotive cabs and cabooses; and (3) as establishing parameters of feasible administrative or engineering controls [emphasis supplied], but to generally require personal protective equipment to reduce noise exposure in those settings where employees may be subjected to more serious hazards associated with railroad operations. This case involves an employee performing maintenance work in a shop. Although it appears that the primary source of noise was a locomotive rather than general "industrial" noise, there is no reason to believe that limiting the employee's exposure by means of personal protective equipment would in any way disrupt safe transportation activities. Accordingly, Commissioner Cleary concludes that this case falls under the portion of the policy statement in which the FRA recognizes the applicability of the OSHA noise standard.

B

In Commissioner Cottine's view, it is clear that FRA did not contemplate affecting employee working conditions in issuing its regulations. See FRA Railroad Noise Emission Compliance Regulations, 42 Fed. Reg. 42,343, 42,349 (1977). Thus, there was no exercise of authority by FRA or EPA[8/] to

---

8/ Commissioner Cottine notes that EPA's comments concerning its railroad noise emission standards, 40 C.F.R. Part 201, show no intent to affect occupational safety and health. See Railroad Noise Emission Standards, 41 Fed. Reg. 2184 (1976); Railroad Noise: Proposed Emission Standards, 39 Fed. Reg. 24,580 (1974). As EPA characterized its approach, "EPA has developed and is now implementing an interstate rail carrier noise control strategy based on section 17 of the [Noise Control] Act that should prove to be effective in reducing environmental noise from railroads in many areas to the levels identified as protective of public health and welfare." 41 Fed. Reg. 2184. The only apparent reference to occupational safety and health was in EPA's response to a comment by the U.S. Department of Transportation that EPA should promulgate a regulation to protect railroad workmen from retarder noise.

(continued on next page)

prescribe or enforce standards or regulations affecting occupational safety or health. No exemption from OSHA standards occurred as a result. See Southern Pacific Transp. Co. v. Usery, 539 F.2d 386 (5th Cir. 1976), cert. denied, 434 U.S. 874 (1977); Union Pacific R.R., 77 OSAHRC 150/A2, 5 BNA OSHC 1702, 1977-78 CCH OSHD ¶ 22,036 (No. 11558, 1977); Consolidated Freightways Corp., 77 OSAHRC 84/A2, 5 BNA OSHC 1481, 1977-78 CCH OSHD ¶ 21,846 (No. 10889, 1977), pet. for review dismissed, No. 77-2515 (9th Cir. Jan. 19, 1979).

Commissioner Cottine further notes that in his view the subsequent FRA policy statement is not a standard or regulation within the meaning of section 4(b)(1) of the Act and therefore cannot operate to preempt the applicability of OSHA standards to railroad operations. He would follow the precedent established in Consolidated Rail Corp., 81 OSAHRC 8/A2, 9 BNA OSHC 1258, 1981 CCH OSHD ¶ 25,172 (Nos. 78-3100 et al, 1981), appeal filed, No. 81-1210 (1st Cir. Apr. 2, 1981), transferred, No. 81-

---

8/ (continued)

> For reasons outlined above, the EPA does not presently propose to regulate retarder noise from either the community health and welfare or the occupational health and safety point of view. The latter consideration is specifically under the purview of the Occupational Safety and Health Administration (OSHA) and is properly addressed by that Agency.

Id. at 2186. Thus, EPA recognized the distinction between public health and welfare considerations, which it addressed, and occupational safety and health considerations, which it did not address. EPA did not exercise any authority to prescribe or enforce standards or regulations affecting occupational safety and health when it promulgated its railroad noise emission standards, 40 C.F.R. Part 201. The same is true of its revised noise emission standards, also codified at 40 C.F.R. Part 201, whose effective date is January 15, 1984. See Noise Emission Standards for Transportation Equipment; Interstate Rail Carriers, 45 Fed. Reg. 1252, 1260 (1980); Proposed Noise Emission Standards for Transportation Equipment: Interstate Rail Carriers, 44 Fed. Reg. 22,960 (1979).

4192 (2d Cir. Oct. 2, 1981)(OSHRC No. 78-3100) & No. 81-2639 (3d Cir. Oct. 2, 1981)(OSHRC No. 78-4881); See also Consolidated Rail Corp., (No. 79-1277), supra, (Cottine, Commissioner, dissenting).

C

Accordingly, both Commissioners Cleary and Cottine conclude the standards and regulations promulgated by the EPA and FRA pursuant to the Noise Control Act are not directed at the working condition cited in this case and therefore do not exempt that working condition from the Occupational Safety and Health Act. See American Petroleum Institute v. OSHA, 581 F.2d 493, 510 (5th Cir. 1978), aff'd on other grounds sub nom Industrial Union Department, AFL-CIO v. American Petroleum Institute, 448 U.S. 607 (1980); Consolidated Freightways Corp., supra. Both Commissioners agree that OSHA is preempted from requiring engineering controls on railroad equipment to reduce the noise levels below those mandated under the Noise Control Act. However, Conrail violated section 1910.95 in this case by failing to provide its employee with proper personal protective equipment.

III

Later in the inspection, the compliance officer observed two employees cleaning parts of a locomotive engine with a spray alkali cleaner. The workers were not wearing eye protection and one of the workers had red, irritated eyes from the alkali spray. According to the compliance officer's testimony, the employees told the compliance officer that they knew eye protective equipment was available but they decided not to use it because they thought they could not see while wearing it. They also said that Conrail's work rule concerning wearing eye protective equipment was not enforced. Because of the danger of eye injuries

from the alkali solution, the Secretary cited Conrail for an other than serious violation of 29 C.F.R. § 1910.133(a)(1).[9/]

In regard to the failure of its employees to wear protective goggles, Conrail emphasized that it has a comprehensive safety program which requires employees to wear goggles when exposed to any irritants. Conrail enforces this safety program, and the employees in question admitted they knew eye protection was available but chose not to wear it.

The Secretary argued that while Conrail may have had a safety program, the fact that employees chose not to wear eye protection because they believed Conrail did not enforce the wearing of it shows that Conrail did not adequately enforce that program. Again, Judge Furcolo agreed with the Secretary, relying on the compliance officer's testimony. Accordingly, he held that Conrail committed an other than serious violation of section 1910.133(a)(1).

We conclude that Judge Furcolo was correct in finding that Conrail violated section 1910.133(a)(1). The record shows that Conrail's employees were not wearing eye protective equipment where there was a danger

---

9/ 29 C.F.R. § 1910.133(a)(1) provides:

> § 1910.133 Eye and face protection.
>
> (a) General. (1) Protective eye and face equipment shall be required where there is a reasonable probability of injury that can be prevented by such equipment. In such cases, employers shall make conveniently available a type of protector suitable for the work to be performed, and employees shall use such protectors. No unprotected person shall knowingly be subjected to a hazardous environmental condition. Suitable eye protectors shall be provided where machines or operations present the hazard of flying objects, glare, liquids, injurious radiation, or a combination of these hazards.

of eye injury. Conrail argues the defense of unpreventable employee misconduct. To establish the defense, the employer must show it had established workrules to prevent the violation, adequately communicated these rules to its employees, and effectively enforced the rules when violations were discovered. Jensen Construction Co., 79 OSAHRC 49/D3, 7 BNA OSHC 1477, 1979 CCH OSHD ¶ 23,664 (76-1538, 1979).

In this case, a company work rule existed, but testimony indicates it was not sufficiently enforced. Specifically, the two Conrail employees using the alkali spray said the workrule requiring proper eye protection was not enforced and admitted that they decided not to wear the protective equipment. Moreover, both of these workers were using the alkali spray in an open area of the plant. This would indicate that the work rule was not adequately enforced. See Maryland Shipbuilding and Drydock Co., 75 OSAHRC 85/E9, 3 BNA OSHC 1585, 1975-76 CCH OSHD ¶ 20,063 (No. 4503, 1975).

IV

Finally, the compliance officer inspected an area of the plant where cylinders of chlorine were stored. The chlorine cylinders were in a "chlorination building." In the nearby "water disposal building," there was a "chin-type" respirator which fits over the face but does not contain its own air supply. Rather, the employee would breathe through the "chin-type" respirator and the contaminated air would be cleansed by the chemical cartridge in the respirator. Because this type of respirator is inadequate for high concentrations of chlorine, Conrail was cited for an other than serious violation of 29 C.F.R. § 1910.134

(e)(2).[10/] In case of a chlorine leak in the chlorination building, the compliance officer testified, an employee would need a respirator with independent air supply to work in that building. Conrail's shop manager testified that the respirator was meant for use in repairing leaks in the chlorination building.

Concerning the allegation that Conrail did not supply its employees with the proper respirator, Conrail argued that the "chin-type" respirator it made available to its employees was appropriate. Conrail emphasized that the compliance officer admitted the respirator was adequate to allow an employee to escape from a room in which there was a chlorine leak. Conrail further contended that the respirator was not intended for any other purpose.

Judge Furcolo found that,

> Since there was chlorine in the area and there was no contradiction of the testimony that the respirator used did not fully protect against it but a self-contained breathing type would, . . . the correct respirator had not been specified as required by the standard at 29 C.F.R. § 1910.134(e)(2).

---

10/ 29 C.F.R. § 1910.134(e)(2) provides

> § 1910.134 Respiratory protection.
>
> * * *
>
> (e) Use of respirators.
>
> * * *
>
> (2) The correct respirator shall be specified for each job. The respirator type is usually specified in the work procedures by a qualified individual supervising the respiratory protective program. The individual issuing them shall be adequately instructed to insure that the correct respirator is issued.

Accordingly, Judge Furcolo held that Conrail committed an other than serious violation of the standard.

We affirm Judge Furcolo's conclusion that Conrail violated section 1910.134(e)(2). The standard requires that "the correct respirator . . . be specified for each job." Conrail's shop manager testified that the "chin-type" respirator was located in the water disposal building near the chlorination building so that, if there were a chlorine leak in that building, an employee could obtain a respirator from the water disposal building and enter the chlorination building to repair the leak. Thus, contrary to Conrail's argument, the purpose of the respirator was not limited to escape from the chlorination building. The undisputed testimony of the compliance officer indicated that the "chin-type" respirator would be inadequate for making repairs where an undetermined and possibly large amount of chlorine had accumulated. Therefore, the "chin-type" respirator was not the proper respirator and Conrail violated section 1910.134(e)(2).

Judge Furcolo's decision as to Conrail's violations of 29 C.F.R. §§ 1910.95(a), 1910.133(a)(1) and 1910.134(e)(2) is affirmed. Having considered the factors in section 17(j) of the Act, 29 U.S.C. § 666(i), we assess a $300 penalty for the violation of 29 C.F.R. § 1910.95(a) and no penalty for the violations of §§ 1910.133(a)(1) and 1910.134(e)(2).

SO ORDERED.

FOR THE COMMISSION

Ray H. Darling, Jr.

RAY H. DARLING, JR.
EXECUTIVE SECRETARY

DATED: JUL 30 1982

ROWLAND, Chairman, dissenting in part and concurring in part:

I dissent from the majority's findings that Conrail violated the occupational noise exposure standard at 29 C.F.R. § 1910.95(a) and the eye and face protection standard at 29 C.F.R. § 1910.133(a)(1). However, I concur with the majority's finding that Conrail failed to supply its employees with the proper respirators in violation of 29 C.F.R. § 1910.134(e)(2).

The majority correctly states that the Noise Control Act of 1972 is intended in part to protect workers from excessive noise levels. But the majority concludes that EPA and FRA regulations promulgated pursuant to the Noise Control Act do not affect the working condition in this case. I disagree.

The employee in this case was exposed to noise from a locomotive.[11/] The EPA and FRA standards regulate the amount of noise produced by locomotives. The FRA regulation spells out its applicability.

> The provisions of this part apply to the total sound emitted by rail cars and locomotives operated by a carrier as defined in 45 U.S.C. 22 under the conditions prescribed herein and in 40 C.F.R. Part 201, including the sound produced by refrigeration and air conditioning units which are an integral element of such equipment. . . .[12/]

The EPA regulation has a similar applicability section. See 40 C.F.R. § 201.10. The EPA and FRA regulations also enumerate exceptions to the regulations, none of which apply to this case.

---

11/ It is clear from the record that the Secretary's allegation of excessive noise was based on noise from the locomotive and not from any other source or sources.

12/ 49 C.F.R. § 210.3.

By limiting noise from locomotives and other types of railroad equipment, the EPA and FRA regulations afford protection to all persons who are subjected to noise from such equipment, including railroad employees. Section 4(b)(1) therefore preempts the Secretary from enforcing his noise standard in situations where, as in this case, railroad equipment is the source of the allegedly excessive noise. It is irrelevant whether the EPA and FRA regulations provide more or less protection than the OSHA standard. Once another agency exercises its statutory authority over particular working conditions, OSHA is preempted from applying its own standards to those working conditions regardless of the nature or stringency of the other agency's exercise. American Airlines, Inc., 75 OSAHRC 2/C13, 3 BNA OSHC 1624, 1975-76 CCH OSHD ¶ 20,129 (No. 9392, 1975); Mushroom Transportation Co., 73 OSAHRC 51/E10, 1 BNA OSHC 1390, 1973-74 CCH OSHD ¶ 16,881 (No. 1588, 1973).

Moreover, the Secretary cannot apply his standards to the working conditions named in the FRA policy statement over which the FRA has exercised jurisdiction. Consolidated Rail Corp., 82 OSAHRC , 10 BNA OSHC 1577, 1982 CCH OSHD ¶ 26,044 (No. 79-1277, 1982). According to the policy statement:

> FRA views the question of occupational noise exposure of employees engaged in railroad operations, during their involvement in such operations, as a matter comprehended by the regulatory fields over which FRA has exercised its statutory jurisdiction. FRA is therefore responsible for determining what exposure levels are permissible, what further regulatory steps may be necessary in this area, if any, and what remedial measures are feasible when evaluated in the light of overall safety considerations. FRA's exercise of jurisdiction in this area is evidenced, in part, by the issuance of noise compliance regulations (42 FR 42343; August 23, 1977, issuing 49 C.F.R. Part 210) which will be utilized by FRA to enforce the Environmental Protection Agency (EPA) Railroad Noise Emission Standards (40 C.F.R. Part 201). . . .

* * *

> As suggested above, maximum permissible noise emission levels for rail equipment have already been determined by EPA in consultation with FRA. These emission levels, measured as set forth in the EPA standards, should be recognized by OSHA as establishing the parameters of "feasible administrative or engineering controls" with respect to rail equipment, including locomotives, when such equipment is situated in a railroad shop or enginehouse. See 29 C.F.R. § 1910.95(b)(1).

43 Fed.Reg. 10583, 10588 (1978) (emphasis added). Thus, in its policy statement the FRA has exercised exclusive jurisdiction to protect railroad employees against non-industrial noise arising from locomotive operations. The policy statement further explains that OSHA should recognize the emission levels established by the EPA in consultation with FRA as establishing the parameters of feasible administrative or engineering controls and that OSHA's role in the area of protecting workers from non-industrial noise shall be only an advisory one.

> FRA will work with OSHA to evaluate the prudence of requiring personal protective equipment to reduce noise exposure in those settings where employees may be subjected to more serious hazards associated with railroad operations.

Id. Thus, the policy statement demonstrates that the FRA has exercised exclusive jurisdiction over occupational noise exposure from railroad equipment in the railroad industry.

The majority states that its holding is consistent with section 4(b)(1) because it only requires Conrail to give its workers personal protective equipment and does not require Conrail to institute engineering controls to quiet its locomotives. Such a distinction, however, is not appropriate. Engineering controls and personal protective equipment are simply different means of protecting employees against the same

hazard.[13/] To say that the OSHA standard can be applied to require personal equipment because the EPA and FRA regulations only require engineering controls is inconsistent with the principle that the nature or stringency of the other agency's exercise is irrelevant in determining whether a section 4(b)(1) exemption exists. See American Airlines, Inc., supra; Mushroom Transportation Co., supra.

Because both the EPA and FRA have the authority under the Noise Control Act of 1972 to regulate worker safety and health and because these agencies have exercised that authority over the working condition in this case, I would find that OSHA authority over the working condition has been preempted under section 4(b)(1) of the Act.

I would vacate the eye protection item because the Secretary failed to prove that Conrail knew or could have known, with reasonable diligence, that the employees were not wearing protective eye equipment. Such proof is an essential element of the Secretary's case. Marson Corp., OSHRC Docket No. 78-3491 (May 28, 1982) (Rowland, Chairman, dissenting).

It is undisputed that Conrail made appropriate eye protection available and instructed employees to use such equipment. The majority, however, finds Conrail in violation because it did not enforce the use of the equipment, relying on the compliance officer's testimony that the employees involved in the incident told him that the rule was not enforced.

---

13/ The OSHA standard requires both methods of protection under certain circumstances. Section 1910.95(b)(1) provides:

> When employees are subjected to sound exceeding those listed in Table G-16, feasible administrative or engineering controls shall be utilized. If such controls fail to reduce sound levels within the levels of Table G-16, personal protective equipment shall be provided and used to reduce sound levels within the levels of the table.

I disagree with the conclusion that Conrail did not adequately enforce its work rule. The shop manager of Conrail's diesel facility, Mr. Lord, testified that Conrail had an ongoing and comprehensive procedure for enforcing its work rules, including hearings on alleged violations that could lead to disciplinary action. Against this specific testimony, the Secretary offers only uncorroborated hearsay evidence that Conrail did not enforce its work rule. Moreover, the hearsay is particularly unpersuasive in this case because of the exculpatory nature of the statements made by the disobedient employees. In my opinion, Mr. Lord's specific testimony, which was tested by cross-examination, must prevail over the hearsay offered by the Secretary.[14/]

I agree with the lead opinion that Conrail violated section 1910.134(e)(2) by providing an incorrect type of respirator for use in its chlorination building. Conrail contends that the "chin-type" respirator it provided was adequate for purposes of escaping from the chlorination building if a leak should develop. However, Conrail's shop manager testified that the respirator was intended to be used by an employee entering the chlorination building to repair a leak. It is undisputed that the "chin-type" respirator was inadequate for this purpose. Thus, the respirator was not the correct type for its intended use. Accordingly, while I would reverse the judge with respect to the alleged violations of sections 1910.95(a) and 1910.133(a)(1), I agree to affirm his decision with respect to the violation of section 1910.134(e)(2).

---

14/ Because I would find that Conrail adequately enforced its work rule, I need not consider whether the Act imposes a duty on employers to enforce safety rules as well as to establish and communicate such rules. See Marson, Inc., slip op. at 17 n. 17; Borton, Inc., 82 OSAHRC , 10 BNA OSHC 1462, 1982 CCH OSHD ¶ 25,893 (No. 77-2115, 1981) (Rowland, Chairman, dissenting).

| SECRETARY OF LABOR,<br>Complainant<br>v.<br>CONSOLIDATED RAIL CORPORATION,<br>Respondent | OSHRC DOCKET NO. 78-2546 |

Appearances:

Louis De Bernardo, Esq., for Complainant

John R. Jenchura, Esq., for Respondent

DECISION AND ORDER

This case arose under 29 USC, sec. 651 et seq. of the Occupational Safety and Health Act of 1970 (the Act). As a result of an inspection by the Occupational Safety and Health Administration [OSHA] of the Respondent's premises on March 14 to April 28, 1978, Citations 1 and 2 were issued on or about May 24, 1978, charging that the Respondent violated sec. 5(a)(2) of the Act by the serious violation of the standards at 29 CFR 1910.95(a), .106(d)(4)(v), .106(e)(6)(i) and .106(e)(6)(ii) [respectively items 1, 2a-c of Citation #1]; and the other than serious violation of the standards at 29 CFR 1910.106(d)(7)(iii), .157(a)(1), .133(a)(1), .134(e)(2),

.134(e)(3), and .134(f)(2)(iv), [respectively items 1-6 of Citation #2].

On or about June 6, 1978, the Respondent filed Notice of Contest to Citations 1 and 2 and the penalties proposed therefor.

The pertinent sections of the Act and the standards are appended to this decision under appropriate titles.

## Stipulations and Motions

By motion of the parties, the proposed penalty of $420 for items 2a-c of Citation #1 was amended to $250; and the Respondent withdrew its Notice of Contest to items 1 and 6 of Citation #2...Tr. 3, 4.

Although the Transcript does not specifically indicate it, both parties understood that the Respondent also withdrew its Notice of Contest to items 2(a)-(c) of Citation #1 at the time that the motion to amend the proposed penalty was allowed. That is my very clear recollection and it was confirmed to me in a telephone conference with the parties held on January 30, 1979. Following that conference, both parties sent me letters to that effect, which I have marked in evidence as Exhibits C-10 and R-2. In addition, pages 162 and 167 of the Transcript make it clear that the parties had tried the case on that basis. I find that the Respondent withdrew its Notice of Contest to items 2(a)-(c) of Citation #1.

The Respondent is a large company operating railroads that cross state lines...Tr. 4.

It was agreed by the parties that (unless the Respondent prevails in its jurisdictional defense) the Respondent violated item 1 of Citation #1 and a penalty of $300 is appropriate...Tr. 94.

The Respondent moved to dismiss item #1 of Citation #1 on the grounds that OSHA lacked jurisdiction to regulate noise levels; and the citation and standard were vague and defective. The first ground of the motion was denied on the basis that the Federal Railroad Administration had not exercised its authority in any way that would deprive the Occupational Safety and Health Review Commission of jurisdiction. It was later stipulated that the Respondent would renew its jurisdictional defense in its Brief...Tr. 94, 165.

On the second basis (that the citation and standard were vague and defective) the motion was denied on the grounds that the citation and standard were not vague, the Respondent had discovery procedures available to it, there had been an exchange of information between the parties, and the Respondent had shown no prejudice...Tr. 5-11.

Citation #1, Item #1 [1910.95(a)]

It was stipulated that, other than its Section 4(b)(1) jurisdictional defense, the Respondent was not contesting item #1 of Citation #1 or the proposed penalty of $300...Tr. 94, 165.

Section 4(b)(1)

Citing Section 4(b)(1) of the Act, the Respondent moved to dismiss Item #1 of Citation #1 on the ground that there was a lack of jurisdiction because a federal agency had prescribed or enforced regulations affecting occupational safety or health. At the hearing, the motion was denied on the basis that the Federal Railroad Administration had not exercised its authority in any way that would deprive the Occupational Safety and Health Review Commission of jurisdiction to hear and decide the citation

and complaint in the instant case...Tr. 94.

In support of its position, the Respondent's main reliance has been on the standard at 49 CFR 201.11(a). That standard [which is under Title 40, entitled "Protection of Environment"] is obviously an environmental protection regulation concerning noise levels one hundred feet away from the locomotive. I find that that standard was intended to protect the general environment or the general public rather than the Respondent's employees. It would not qualify as an "exercise" of statutory authority or a regulation "affecting occupational safety or health" under Section 4(b)(1).

In view of the stipulation that the jurisdictional defense was the only one being pressed, I find that the Respondent was not in compliance with the standard at 29 CFR 1910.95(a).

Citation #2, Item 2 [1910.157(a)(1)]

Several uncharged fire extinguishers were in the car shop, adjacent to a combustible liquid storage area. The hazard was that, if one were taken to combat fire, it would give no protection to an employee using it...Tr. 96-98, 117, and Exh. C-5. Representatives of the Respondent said that those extinguishers were not in use but had been collected and placed there to be sent out for charging...Tr. 97, 118. That explanation has not been contradicted in any way, and I find it to be both reasonable and honest. The Complainant has not sustained the burden of proving the Respondent was not in compliance with the standard at 29 CFR 1910.157(a)(1).

Citation #2, Item 3 [1910.133(a)(1)]

In a large open area in the Diesel shop, two employees who were spraying industrial alkali cleaner were not wearing protective glasses when, as the Respondent's shop manager (Lord) admitted, they should have been. The hazard was the possibility of eye injury caused by a splash; and, in fact, one employee had a red and irritated eye from the cleaning fluid...Tr. 100-103, 124, 146.

Adequate personal protective equipment was available and the Respondent had specific written and oral safety rules calling for employees to wear protective glasses under the conditions here...Tr. 138-143 and Exh. R-1. However, both employees told the OSHA Compliance Officer that that safety rule was not enforced...Tr. 125.

Since one general foreman and two line foremen were assigned to the Diesel shop, and the two employees were working in an open area in it, a reasonable conclusion is that the Respondent had knowledge of the violation...Tr. 149.

I find that the Respondent was not in compliance with the standard at 29 CFR 1910.133(a)(1).

Citation #2, Items 4 and 5 [.134(e)(2) and (3)]

Cylinders of chlorine were stored in a "shanty" near the water disposal area building. "Chin-type" respirators, which were kept in the water disposal area building, covered the whole face but were not a self-contained breathing apparatus. The hazard was that chlorine might get into the breathing zone, causing pulmonary edema or eye irritation or death. The condition could be abated by the use of self-contained

breathing apparatus...Tr. 105-115, 131-133, 156, and Exh. C-6 (pages 8, 9, 15), C-7, C-8, and C-9.

The Respondent contended that there had been no need to use a respirator since at least 1975; the water disposal plant operator was trained in the use of the respirator; only one or two employees needed to use it; and there were written instructions in the lid of the respirator container...Tr. 156-160.

Since there was chlorine in the area and there was no contradiction of the testimony that the respirator used did not fully protect against it but a self-contained breathing type would, I find that the correct respirator had not been specified as required by the standard at 29 CFR 1910.134(e)(2).

Concerning the alleged violation of the standard at .134(e)(3), the Compliance Officer apparently intended to testify that employees of the Respondent had said they were not familiar with written procedures concerning the use of respirators...Tr. 115, 116. However, there was never any clear evidence to that effect. On the other hand, the Respondent's employee [Scatko] in charge of that phase of the Respondent's business, testified clearly that adequate instructions in the respirator container were known to employees who would use it...Tr. 159-160. That testimony was not contradicted.

In that state of the evidence, I find that the complainant has not sustained the burden of proving the Respondent was not in compliance with the standard at 29 CFR 1910.134(e)(3).

## Findings of Fact

Having heard the testimony, observed the witnesses, and examined the exhibits, the following Findings of Fact are made:

1. At all times concerned, the Respondent regularly received, handled or worked with goods which had moved across state lines.

2. As concerns Item #1 of Citation #1, the Federal Railroad Administration had not prescribed or enforced any standards or regulations affecting occupational safety or health; and it was stipulated that lack of jurisdiction was the Respondent's only defense to the alleged violation.

3. As concerns Items 2a-c of Citation #1, and Items 1 and 6 of Citation #2, the Notice of Contest was withdrawn.

4. As concerns Item #2 of Citation #2, the fire extinguishers in question were not being "kept" but had been temporarily placed in the car shop awaiting removal to be charged.

5. As concerns Item #3 of Citation #2, two employees were not required to use protective eye and face equipment.

6. As concerns Item #4 of Citation #2, the correct respirator was not specified for each job.

7. As concerns Item #5 of Citation #2, there was insufficient evidence to establish that Respondent's personnel were not familiar with written procedures for the safe use of respirators.

8. The conditions described in Item #1 of Citation #1 exposed the Respondent's employees to sustaining serious harm because of the hazard of impairment of hearing due to excessive noise.

9. The conditions described in Item 3 of Citation #2 exposed the Respondent's employees to sustaining harm because of the hazard of industrial alkali cleaner splashing into the eyes.

10. The conditions described in Item 4 of Citation #2 exposed the Respondent's employees to sustaining harm because of the hazard of chlorine getting into the breathing zone, causing pulmonary edema or death.

11. One or more officers or supervisory personnel of the Respondent knew of the hazardous conditions described herein and knew that employees were exposed to such hazards.

## Conclusions of Law

1. At all times concerned, the Respondent was an employer engaged in a business affecting commerce within the meaning of the Act; and the Occupational Safety and Health Review Commission has jurisdiction over the subject matter and the parties.

2. At all times concerned, the Respondent knew, or with the exercise of due diligence should have known, of the alleged violations.

3. On the date in question, the Respondent was not in compliance with the standards at 29 CFR 1910.95(a); .106(d)(4)(v); .106(e)(6)(i); .106(e)(6)(ii); .106(d)(7)(iii); .133(a)(1); .134(e)(2); and .134(f)(2)(iv); and the Complainant has sustained the burden of proving the Respondent violated sec. 5(a)(2) of the Act (sec. 654).

4. The Complainant has not sustained the burden of proving the Respondent violated the standards at 29 CFR 1910.134(e)(3) and 29 CFR 1910.157(a)(1).

## Order

The whole record having been considered, and due consideration having been given to 29 U.S.C., sec. 666(j), it is ordered:

1. Items 1 and 2a-c of Citation #1 are affirmed, and a penalty of $300 is assessed for Item #1.

2. Items 1, 3, 4, and 6 of Citation #2 are affirmed.

3. Items 2 and 5 of Citation #2 are vacated.

SO ORDERED.

Foster Furcolo

FOSTER FURCOLO

## APPENDIX

### The Act

Section 653(b)(1) [Section 4(b)(1)] "Nothing in this Act shall apply to working conditions of employees with respect to which other Federal agencies...exercise statutory authority to prescribe or enforce standards or regulations affecting occupational safety or health."

Section 654 [section 5(a)(2)] Employer"...shall comply with occupational safety and health standards..."

Section 666 [section 17(b)] "...employer who has received a citation for a serious violation...of this Act...shall be assessed a civil penalty of up to $1,000 for each such violation."

Section 666 [section 17(c)] "...employer who has received a citation for a violation of...this Act...specifically determined not to be of a serious nature, may be assessed a civil penalty of up to $1,000 for each such violation."

Section 666 [section 17(j)] "...assess all civil penalties...giving due consideration to...the size of the business... gravity of the violation, the good faith of the employer, and the history of previous violations."

Section 666 [section 17(k)] "...a serious violation shall be deemed to exist...if there is a substantial probability that death or serious physical harm could result...unless the employer did not, and could not...know of the presence of the violation."

### The Standards

29 CFR 1910.157(a)(1): Portable fire extinguishers "shall be maintained in a fully charged and operable condition, and kept in their designated places at all times when they are not being used."

29 CFR 1910.133(a)(1): "Protective eye and face equipment shall be required...employers shall make conveniently available a type of protector suitable...and employees shall use such protectors..."

29 CFR 1910.134(e)(2): "The correct respirator shall be specified for each job... The individual issuing them shall be adequately instructed... Each respirator permanently assigned to an individual should be durably marked to indicate to whom it was assigned... The date of issuance should be recorded."

29 CFR 1910.134(e)(3): "Written procedures shall be prepared covering safe use of respirators... Personnel shall be familiar with these procedures."

49 CFR 201.11(a): "...no carrier...shall operate any locomotive... which produces sound levels in excess of 93 dB(A)... at 30 meters (100 feet) from the geometric center of the locomotive..."

[This standard is found under Title 40, which is entitled: "Protection of Environment."]

# OCCUPATIONAL SAFETY AND HEALTH REVIEW COMMISSION

## NOTICE OF DECISION

Secretary of Labor v. FOESCO, INCORPORATED
OSHRC Docket No. 81-944

1. Enclosed is a copy of my decision. It will be filed with the Commission on June 28, 1982, and will become the final order of the Commission on July 28, 1982, unless a Member of the Commission directs that it be reviewed.

2. You may petition for discretionary review of this decision by the Commission. A petition may be filed directly with me within twenty (20) days from the mailing of my decision. Thereafter, a petition should be mailed to the Executive Secretary, Attention:

   Chief Review Counsel
   Occupational Safety and Health Review Commission
   1825 K Street, N.W., Suite 601
   Washington, D.C. 20006.

   Any petition filed directly with the Commission will be considered to the extent that time and resources permit. The last day the Commission may consider your petition is July 28, 1982. This final order date is fixed by law and cannot be extended under any circumstances.

3. If review is ordered by a Member of the Commission, each party to this case will be notified. In addition, each party will be given an opportunity to submit a brief to the Commission.

4. Please complete the enclosed postcard indicating whether you presently intend to seek review of this decision and mail the completed card promptly. Your response does not bind you in any way, but it assists the Commission in processing your petition when it is filed.

5. For any further details on the review process, see Commission Rules 90, 91, 92, and 93.

## STATEMENT OF THE CASE

This case arises under the provisions of Section 10(c)[1/] of the Occupational Safety and Health Act of 1970 (hereinafter the Act).[2/] There is at issue a six-Itemed Serious Citation issued pursuant to Section 9(a) of the Act[3/] by the Secretary of Labor through the Area Director of the Occupational Safety and Health Administration (OSHA) for Pittsburgh, Pennsylvania, (hereinafter Complainant) to Foseco, Incorporated, Mt. Braddock, Pennsylvania (hereinafter Respondent). Penalties totalling $1,960 were proposed by Complainant pursuant to Section 10(a) of the Act.[4/]

After the filing of a Notice of Contest (R.p. 3)[5/] the perfection of the pleadings, and pre-trial discovery, a four day hearing was held in Pittsburgh, Pennsylvania. No affected employee or representative thereof claimed party status (Tr. 4).

4/ 29 U.S.C. 659(a).

5/ References herein translate as follows:

R.p. 3 The third numbered document in the official Docket File prior to assignment to the undersigned.

R.p. J-3 The third numbered document in the official Docket File after assignment to the undersigned.

Tr. 27 Page 27 of the hearing transcript.
Exh. C-1 Complainant's Exhibit in evidence.
Exh. R-1 Respondent's Exhibit in evidence

This citation arose from an inspection of Respondent's Mt. Braddock plant in Mt. Braddock, Pennsylvania on February 5, 1981.

The Serious Citation alleges the following:

> Item 1
> Section 5(a)(1) of the Occupational Safety and Health Act of 1970:
>
> The employer did not furnish employment and a place of employment which were free from recognized hazards that were causing or likely to cause death or serious physical harm to employees in that:
>
> > (a) Management permitted an oil fired furnace to be used, exposing the open flame to the raw material batching area atmosphere, in which fine particles of aluminum dust and powder was liberated.

Abatement was ordered by March 13, 1981 and a $420 penalty was proposed.

> Item 2
> Section 5(a)(1) of the Occupational Safety and Health Act of 1970:
>
> The employer did not furnish employment and a place of employment which were free from recognized hazards that were causing or likely to cause death or serious physical harm to employees in that:
>
> > (a) Management permitted the accumulation of aluminum powder and dust on building supports, equipment, electrical fixtures, bundles of news papers and the floor of the Raw Material Batching Area, which are not regularly cleaned during daily operations. This condition exposes employees to possible flash fire and/or explosion.

Abatement was ordered by March 23, 1981 and a $350 penalty was proposed.

Item 3
29 CFR 1910.157(b)(2)(i): Portable fire exinguisher(s) [sic] were not selected for the specific class(es) of harard(s) [sic] to be protected:

(a) Raw Material Batching Area; the extinguishers and extinguishing agents for the protection of Class "D" hazard of aluminum powder and dust generated by the dumping and batching operation.

Abatement was ordered by March 23, 1981 and a $280 penalty was proposed.

Item 4
29 CFR 1910.178(c)(2)(vi):[6/] Non-approved powered-operated industrial trucks were being used in an atmosphere containing hazardous concentrations of metal dust:

(a) Raw Material Batch Area; Allis-Chalmers, Model ACCC-40, fork lift and a Clark towmotor, were being used to transport open end five gallon metal containers of aluminum powder.

Abatement was ordered by March 13, 1981 and a $280 penalty was proposed.

Item 5
29 CFR 1910.309(a) Section 502-4(a), National Electrical Code, NFPA 70-1971, as adopted by 29 CFR 1910.309(a): Wiring method(s) employing threaded rigid metal conduit or type MI cable(s) with termination fitting(s) were not used in Class II Division 1 locations(s): [sic]

(a) Raw Material Batching Area; overhead wiring and receptacles were not in conduit of the approved type.

Abatement was ordered by April 13, 1981 and a $350 penalty was proposed.

---

6/ The Citation as issued alleged in item 4, a violation of the Standard set forth at 29 C.F.R. 1910.178(c)(2)(vii) (R.p. 1). Complainant's written Motion, filed one week before trial, (R.p. J-47), to amend Item 4 to allege a violation of 29 C.F.R. 1910.178(c)(2)(vi), which amendment did not alter the wording of this Item, was granted on the first day of trial, after argument from both parties (Tr. 12-32).

Item 6
29 CFR 1910.309(a) Section 502-6(a)(3), National Electrical Code, NFPA 70-1971, as adopted by 29 CFR 1910.309(a): Fuse(s) switch(es), motor controller(s) and circuit breaker(s) located where dust from magnesium, aluminum, aluminum bronze powders, or other metals of similarly hazardous characteristics were present, were not specifically approved for Class II Division 1 location(s):

(a) Raw Material Batching Area; the electrical board containing 110 and 240 volt disconnect switches and receptacles located along the west wall. (R.p. 1)

Abatement was ordered by April 13, 1981 and a $280 penalty was proposed.

The cited law and OSHA Standards provide as follows:

Section 5(a)(1) of the Act:

Sec. 5. (a) Each employer -
(1) shall furnish to each of his employees employment and a place of employment which are free from recognized hazards that are causing or are likely to cause death or serious physical harm to his employees;

* * *

29 U.S.C. 654(a)(1)

29 C.F.R. 1910.157(b)(2)(i):
Portable Fire Suppression Equipment

* * *

(2) Selection by hazard. (i) Extinguishers shall be selected for the specific class or classes of hazards to be protected in accordance with the following paragraphs.

* * *

29 C.F.R. 1910.178(c)(2)(vi):

(vi)(a) Only approved power operated industrial trucks designated as EX shall be used in atmospheres in which combustible dust is or may be in suspension continuously, intermittently, or periodically under normal operating conditions, in quantities sufficient to produce explosive or ignitable mixtures, or where mechanical failure or abnormal operation of machinery or equipment might cause such mixtures to be produced.

29 C.F.R. 1910.309

National Electrical Code.

(a) The requirements contained in the following articles and sections of the National Electrical Code NFPA 70-1971; ANSI CI-1971 (Rev. of Cl-1968) shall apply to all electrical installations and utilization equipment:

Articles

* * *

502-4. Wiring Methods. Wiring methods shall conform to the following:

(a) Class II, Division 1. In Class II, Division 1 locations, threaded rigid metal conduit or Type MI cable with termination fittings approved for the location shall be the wiring method employed. Type MI cable shall be installed and supported in a manner to avoid tensile stress at the termination fittings.

* * *

502-6. Switches, Circuit Breakers, Motor Controllers, and Fuses.

Switches, circuit breakers, motor controllers and fuses shall conform to the following:

* * *

(3) Metal Dusts. In locations where dust from magnesium, aluminum, aluminum bronze powders, or other metals of similarly hazardous characteristics may be present, fuses, switches, motor controllers and circuit breakers shall have enclosures specifically approved for such locations.

## ISSUES

1. Did the methods used by Respondent in pre-batching (measuring) atomized aluminum powder at its Mt. Braddock plant result in an explosive or ignitable atmosphere or result in the accumulation of aluminum dust layers on the building components, equipment and material stored in the pre-batch area of this building so as to cause a danger of an aluminum flash fire or an explosion?

2. Did the conditions produced by Respondent's pre-batching methods constitute violations of Section 5(a)(1) of the Act, (the General Duty Violations, Items 1 and 2 of the Citation), or the cited Standards, (Items 3 thru 6 of the Citation)?

Both issues are answered in the negative.

## EVIDENCE

The record in this case reveals that the Respondent is part of a British owned company which has operations in Canada, Australia, Japan, and the United States. Its Mt. Braddock, Pennsylvania plant was incorporated in Delaware and this case involves only one of seven major buildings,

the "Prebatch Building", located at this Mt. Braddock facility (Tr. 7, 8, 50, 60, 61). There are an average number of 75 employees working at the Mt. Braddock facility and Respondent conceded that this facility falls under the jurisdiction of the Act (Tr. 9, 10).

At this facility, Respondent is engaged in manufacturing specialty chemical products which it supplies to steel mills and the foundry industry. Ninety percent of its production at this facility consists of insulating boards, the remainder involves blended powder products and "briquets" sold to foundries. The insulating boards, range in size from 1 foot x 1 foot x 1 inch thick to 4 feet x 4 feet x 1 1/2 inch thick and are used by foundries and steel mills to line ingot molds to control the cooling of molten metal which aids in the production of high grade steel. The boards are intended to and are consumed by the molten steel in the molds and thus can be used only once.

The prebatching of atomized aluminum powder, the work practice giving rise to the Citation at issue here, is carried out in Respondent's "prebatch building". This building is a large metal warehouse with a concrete floor. It measures approximately 122 feet in length, 80 feet in width with the roof structure approximately 25 feet above the concrete floor (Exh. R-1). The North end of this building, occupying an area approximately 26 feet deep for the entire 80 foot width of the

building is the prebatch area (Exh. R-1). The rest of the building is used to store material. The prebatch area (worksite) is not separated from the rest of the interior of this building.

Prebatching, as used in this record, essentially means weighing out specified amounts of the various ingredients which go into the fabrication of the insulating boards and other products Respondent manufactures.

The following materials are prebatched at this worksite:

Newsprint, i.e., newspapers, rayon fibers, calcium silicate fiber, synthetic resin in fine powder form, silica sand, and atomized aluminum powder.

Respondent's total daily production amounts to 110,000 pounds plus 40,000 pounds of water which is dried off. The aluminum powder used in fabricating these insulation boards, one of a number of ingredients, amounts to only 0.17 of one percent of the raw material batched at this worksite. The major raw material prebatched at this worksite is the synthetic resin in fine powder form. The insulating boards are fabricated by mixing predetermined, fixed amounts of various powders, fibers and organic ingredients with water to produce a slurry, which is molded into the desired shapes, dried in an oven and then packed for shipment. The measuring out of the specific ingredients to specified quantities is done in the prebatch area. The ingredients are then taken elsewhere at

the facility for the mixing, molding, drying and preparation for shipment functions.

The atomized aluminum powder used by Respondent at its facility, was supplied in 55 gallon metal-lidded drums by either Reynolds Aluminum or the Aluminum Company of America. It consisted of pear shaped particles of 30 micron size having a relatively high bulk density. This powder is dark grey in color and is considered a "heavy" powder, having an "explosibility index number" of between 1.2 and 1.8. The "explosibility index number" is a rating for dusts, developed by the U. S. Bureau of Mines, to rate the propensity of various dusts to explode, when measured against Pittsburgh coal dust, which is rated at 1. The higher the index number the more explosive the dust. Household flour has an index rating of between 5 and 6 (Tr. 600 - 605, Exh. C-8, p. 7, Figure 2).

The prebatching procedures followed by Respondent prior to the inspection of February 5, 1981, from which this case arose,[7/] were as follows:

The 30 micron sized atomized aluminum powder was received by Respondent in 55 gallon metal drums sealed by metal lids. The drums were stored, ready for use in the storage areas in the prebatch building (See Exh. R-1), and normally about 4 sealed drums were kept in storage.

7/ Shortly after this inspection, Respondent terminated its prebatching of aluminum powder and since that time has not used aluminum powder at this facility.

Three or four days per week, there was a need to prebatch the aluminum powder for the fabrication of the insulating boards. As this need arose, an employee, using a propane fueled Allis-Chalmers, Model ACCC-40 forklift truck brought a 55 gallon drum from the storage area to the prebatching area. This drum was clamped securely into a tilting apparatus affixed to this forklift during this transit.

When the forklift truck was positioned near a metal trough in this area, also referred to as a "mortarbox", (See Exh. R-1 on which this trough is represented as a rectangular shape with the work "ALUM." appearing thereon), the drum was elevated 2 or 3 feet above the edge of the trough and the engine of the forklift was turned off. Then the lid of the drum was removed and using the manually operated tilting device, the 600 pounds of aluminum powder in the drum was emptied into the trough.

Two employees were regularly assigned to carry out the prebatching functions performed at this worksite, Messers. Feniello and Bukovac. Each had been employees for approximately 5 years with their major duties consisting of prebatching various raw materials.

Both employees appeared as witnesses, Mr. Feniello for Complainant (Tr. 318 - 393) and Mr. Bukovac for Respondent (Tr. 667 - 703).

No significant discrepencies appear in their testimony. They testified that they are supplied respirators by Respondent

and wear them during their prebatching operations pursuant to a company rule. Similarly, neither smoke during their operations in comformance with another company rule.

The procedure of dumping the drum of aluminum powder produces a small cloud of dust, which rises about 4 feet above the top of the trough, and extends roughly 1 foot on either side of the trough and quickly settles to the floor.

The trough is metal, measures approximately 1 foot in depth and 6 feet long, was purchased and installed at the worksite as a new piece of equipment approximately four years before the inspection and has been painted with a brownish appearing paint.

After the aluminum powder is dumped into this trough, the prebatching employees, using aluminum shovels, transfer the powder into metal pails, filling each pail with 50 pounds of powder, the desired amount. Photographic Exhibits C-1 and C-2 show this operation. The pails are on some type of scale when being filled and when the desired amount of powder is shoveled into the pails, they are placed on pallets and taken by forklift truck to another building at this facility where the powder is added to the slurry for the insulating boards. During this shoveling operation, which takes about one hour, small amounts of the powder drop to the floor. Additionally, a very small dust cloud is produced, (it raises about 3 feet above the pail and is 6 to 8 inches in diameter), which quickly settles out onto the floor. At the end of each days

shift, the prebatch employees clean the prebatch area, removing all scrap material, i.e., empty bags, etc., and sweep up any spilled powder. This trash is put into containers, and removed from the building for later removal from the facility. These two employees have never received any special instructions concerning the prebatching of aluminum powder.

In the Northeast corner of this prebatch area, there is located two vented hoods connected to a dust collecting system. The hoods measure about 6 feet long by 4 feet deep and were located about 4 to 5 feet above the concrete floor. (See Exh. R-1, equipment labeled "Dust Collector"). Although the prebatching employees had been directed to prebatch all materials under these ventilation hoods, they routinely did not prebatch the aluminum powder under the hoods because it was "easier" not to, and because the trough or "mortar box" was positioned some 20 to 30 feet away from the hoods. However, the dust collectors were turned on each morning and remained operative during the work day. Both the fiberglass fibers and the clay ingredients of the insulating boards were batched under the ventilation hoods, essentially because the fiberglass fibers caused the employees some skin irritation if the fibers got onto their skin, they were "itchy".

This large prebatch-warehouse building had two, 10 foot wide garage doors and two "man" doors, i.e., personnel doors.

One garage door boarded the prebatch area in the West wall of the building with one personnel door directly opposite it in the East wall, some 80 feet away. The other garage door was also on the West wall at the South end of the building some 100 feet away from the other garage door. The second personnel door was very near the South garage door in the South wall of the building (See Exh. R-1).

Although the garage door nearest the prebatch area was used to move material in and out of this area, it remained closed the great majority of the time, even in the summertime. The personnel doors were used primarily by the two prebatch employees. Thus, the prebatch area was not subject to constant drafts or winds coming through these doors, and both employees testified that they had never seen the very small clouds of aluminum dust caused by the prebatching operation drift away from the immediate area of the trough or "mortar box".

Approximately 16 feet from the prebatch trough in an Easterly direction, near the North wall of this building, there was located an oil-fired furnace (See Exh. R-1). It had been installed approximately four to six weeks before the inspection herein to provide heat for the two prebatch employees. Although there is some small confusion in the evidence as to whether or not it had ever operated, at any

rate it was not in operation during the February, 1981, inspection from which this case arose.

On the East wall of the prebatch area some 24 feet from the aluminum prebatching trough, approximately ten electric circuit breaker boxes were located (See Exh. R-1, equipment labeled "Elec. Panels"). Seven of these ten boxes were non-operative as the machinery which they had been connected to were not operative and had not been in use for some considerable period. (See Exh. R-1, where the non-operating equipment is shown along the North wall of the prebatch area, labeled "Disregard equipment").

The prebatch area was lighted by overhead lights. The wires to these lights ran from the circuit breaker boxes, thru metal conduits to the overhead fixtures. These metal-clad wires were covered with some type of foam insulating material. Finally, fire extinguishers of either a "B-C" or "A-B-C" classification were located just to the North of the garage door on the West wall and the personnel door on the East wall (See Exh. R-1).

The Respondent produced Mr. Allan Osborne, the Plant Manager of the Mt. Braddock facility who had held that position for approximately five years. He initially began his employment with Foseco in England in 1964 as a chemical analyst, progressing through the positions of

Quality Control Technician, Process Control Manager and Plant Manager in England, while completing his education, finally transferring to the Mt. Braddock facility as its Manager.

Mr. Osborne confirmed in all essential respects, the testimony of the two prebatching employees, Messers. Feniello and Bukovac, and rated them as careful and experienced employees. Further, he testified that there never had been any fire or explosion in either the prebatch area or in the entire facility in any way connected with the prebatching of the atomized aluminum powder. Further, during his five year tenure as Plant Manager, there had never been a malfunction of either the electric circuit breaker boxes or the electric circuitry in the prebatch building.

At Mt. Braddock monthly safety meetings are held with Mr. Osborne, Mr. Tabasco, the Production Manager, and a union member in attendance. Prior to this meeting, Mr. Tabasco tours the entire plant and there is a procedure for employees to complete a safety request form. Any such requests or other safety matters are dealt with in these monthly safety meetings and the minutes of these meetings are posted on bulletin or "notice" boards. No complaints concerning the aluminum prebatching operation have ever been submitted.

Based on his education, which consisted in part, of a major in metallurgy, and long experience with Foseco in

England and particularly as Plant Manager at the Mt. Braddock facility, Mr. Osborne was of the opinion that the prebatching of the atomized aluminum powder as carried on at his plant did not present any hazard because of the manner in which it was handled. He further frankly acknowledged that under "very certain conditions", a spark related to working with aluminum powder can be a hazard, the hazard being a fire or explosion, characterizing such knowledge as "general knowledge about aluminum powder" (Tr. 828, 829). However, such hazards in his view, are not existent at his facility, essentially because the atomized aluminum powder in use was "very dense" and hence there was no realistic possibility that an aluminum dust cloud of sufficient concentration in the air could be generated to support an explosion. Further, although admitting that the prebatching area was a "dusty area", he maintained that the 30 micron sized aluminum powder used did not create aluminum dust clouds of any significance, and he had never seen what small clouds were created, drift away from the immediate vicinity of the aluminum batching trough. In his view, most of the dust in this "dusty area" was caused by the batching of resin, a major powdery material handled in that area (Tr. 745 - 852). Mr. Osborne's testimony, because of its frankness and clarity together with his demeanor, education and long experience with the Respondent company, is fully credible.

## THE INSPECTIONS

The record reveals that this Mt. Braddock facility had its first OSHA general inspection in November, 1980. No citations issued as result of that inspection but, as a consequence thereof, a second OSHA hygiene inspection was made the following month, in December, 1980, by OSHA Industrial Hygienist Voycik. During Mr. Voycik's inspection, air samples were taken of the prebatching area, with sampling devices attached to both Messers. Feniello and Bukovac for a major portion of a normal workday which included prebatching aluminum powder. Hygienist Voycik did not take any wipe samples of any dust which had settled in the prebatch area.

The air samples which were taken resulted in a finding of "silica and nuisance" dust. These samples were not subjected to any analysis to determine if any of the dust which was sampled contained any aluminum dust. The dust which was found and identified as "silica and nuisance" dust in the air samples was determined by weighing the filters before and after sampling. This dust consisted of 50.85 miligrams per cubic foot of air, which converts to .00005 onces per cubic foot of air.[8/] As a result of Mr. Voycik's inspection, citations were issued to this Respondent. Although initially contested by Respondent, that case ultimately was completely settled by the parties. Sec. of Labor v. Foseco Inc., OSHRC Docket No. 81-477. (Tr. 210 - 242; 778).

8/ The significance of these air sampling results is explained *infra*.

As a further consequence of Mr. Voycik's hygiene inspection in December, 1980, a third OSHA inspection was made of Respondent's prebatching operation on February 5, 1981, by OSHA Compliance Officer (C. O.) Seifert. It is this February, 1981 inspection upon which the Citation here determined is based.

C. O. Seifert, upon a referral from Mr. Voycik went to Respondent's Mt. Braddock facility on February 5, 1981 to inspect its prebatching operation because during Mr. Voycik's hygiene inspection, some question arose in Mr. Voycik's mind that there might be either an explosion or fire hazard created by the prebatching of the aluminum powder where there was also present, a source of ignition.[9/]

When Mr. Seifert arrived at the prebatch area, no operations were taking place. He asked the two prebatch employees, Feniello and Bukovac how they prebatched the aluminum powder. There was already some aluminum powder in the trough, so after explaining how the 600 pound drum of powder was emptied into the trough, one of the employees, using an aluminum shovel, put two shovels full of the aluminum powder into a couple of pails. The C. O. photographed this operation (See Exhs. C-1, C-2).

9/ During Mr. Voycik's December inspection, he evidently observed a "salamander" kerosene heater in use in the prebatch area which provided warmth to the two prebatch employees. This is a so-called "smudge pot" type of heater, essentially a round container of kerosene or other type of oil with a metal chimney. Heat is produced by a flame burning the fuel.

Mr. Seifert then observed the oil fired furnace near the North wall of the building which was not operative. The salamander heater, observed by Mr. Voycik in his December hygiene inspection had been removed by Respondent and the furnace installed in its place. C. O. Seifert then observed a propane fueled forklift truck, noted the overhead lights and traced the metal clad conduits to the circuit breaker boxes on the West wall. He further noted the fire extinguishers in place as well as the generally dusty appearance of the building structure itself as well as dust on stacks of newspapers near the aluminum trough (See Exh. R-1 - "Paper Bundles" and "Bin of Paper Bundles").

This C. O. did not take any measurements whatever during his inspection, i.e., of distances of the furnace, overhead lighting and wiring, or circuit breaker boxes from the aluminum trough.

Most importantly, he did not take any air samples during the extremely brief shoveling operation he observed nor any wipe samples of the dust he observed in the prebatch area.[10/] This entire inspection took approximately one hour.

10/ Mr. Seifert testified that he had received so-called "cross-over" training in the taking of environmental samples, so was qualified to at least take wipe samples of the dust he observed so its contents could have been identified (Tr. 150).

From his inspection, Mr. Seifert concluded that an aluminum fire and/or explosion hazard was present at Respondent's prebatch area. He reasoned that the prebatching of the 30 micron atomized aluminum powder created aluminum dust. Further, he concluded that the dust which he observed in this area was aluminum dust. He then found what he considered to be potential sources of ignition, namely, the oil fired furnace, the metal clad wiring to the overhead lights, and the circuit breaker boxes, should they malfunction, and the electrical and exhaust systems of the forklift trucks used in the area, should they malfunction, i.e., backfire, or strike a steel support member of the building. Based on this rationale, he recommended the issuance of the Serious Citation herein (Tr. 63 - 183; 243 - 315; 623 - 664).

Although C. O. Seifert is an experienced and honest Compliance Officer, with nine years of experience in this position with OSHA, having made about 600 OSHA inspections, one third of which involved fire safety, and with a 30 year employment history involving in one form or another, fire protection, the substantial evidence of this record does not support his conclusion as to an aluminum dust hazard at Respondent's prebatching operation as is shown <u>infra</u>.

## THE EXPERT WITNESS' TESTIMONY

Both parties presented the testimony of highly qualified expert witnesses, Mr. John Nagy for Complainant (Tr. 424 - 622), and Mr. Arthur Craven for Respondent (Tr. 853 - 992). There is no significant controversy in their testimony except for their final opinions, Mr. Nagy believing there was an extremely slight possibility of an aluminum fire or explosion at Respondent's prebatch area, essentially based on the testimony of C. O. Seifert and employee Feniello, and Mr. Craven believing there was no aluminum fire or explosion hazard, based on his study of Respondent's prebatch area and practices and the 30 micron atomized aluminum powder used in this process.

Based on an exhaustive study and very careful analysis of this evidence, it is concluded that Mr. Craven's final opinion must be accorded the most weight.

Mr. Nagy, a veteran of 43 years of outstanding Governmental service with the U. S. Bureau of Mines (1936 - 1973) and U. S. Mine Safety and Health Administration (1973 - 1979) has since his retirement, engaged in private consulting work for the past three years. His Governmental service was directed to the study of mining hazards, including gas and dust explosions, carried on in Bureau of Mines laboratories and an experimental coal mine near Pittsburgh, Pennsylvania. He developed test equipment and procedures to evaluate various

parameters associated with various types of dusts, including aluminum dusts. He has authored or co-authored approximately 100 formal publications, 30 of which deal exclusively with industrial types of dust explosions and safe practices. He has served on numerous committees and sub-committees of the National Fire Protection Association. He holds an M.S. Degree in Physics from the Carnegie Mellon Institute awarded in 1936 and numerous awards for his outstanding Governmental service: (See Exh. C-7, Mr. Nagy's Curriculum Vitae).

Mr. Nagy defined a "dust explosion" as, ". . . the ignition of combustible dust so that flame and pressure in a confined or partially confined volume is produced." (Tr. 474, underlined supplied).[11/] He stated that there are a number of factors effecting dust explosions, including aluminum dust explosions, such as, particle size, concentration of particles, oxygen concentration in the atmosphere and the amount of inert particles which may be present in the dust cloud. During his studies of dust he has considered various parameters, such as ignition temperatures, concentration of dust, concentration of oxygen in the atmosphere, the minimum electrical energy required for ignition, susceptibility of material to ignite by frictional sparks, pressure and rates of pressure rise developed in closed laboratory equipment, the effects of

11/ As set forth infra, Mr. Craven's definition of a dust explosion is in essential agreement with Mr. Nagy's.

venting pressure, particle size distribution, and the effects of inert additives to reduce explosibility. In his studies of aluminum dusts, he found that the minimum concentration of 30 micron sized aluminum particles within a dust cloud necessary to produce an explosion was .04 ounces of aluminum particles per cubic foot of air (hereinafter .04 oz./ft.$^3$).[12/] His experiments did not determine the minimum electric spark (electric energy) necessary to ignite the minimum dust cloud concentration. Rather, using an optimum aluminum concentration dust cloud (with a concentration of aluminum dust particles higher than .04 oz./ft.$^3$), and using a continuous electric spark in his laboratory equipment, he deduced that the minimum amount of electric energy (electric spark) necessary to ignite a minimum aluminum concentration cloud (.04 oz./ft.$^3$) would be approximately 200 millijoules, a spark comparable to that produced by an automotive spark plug.

Further, he conducted laboratory experiments utilizing a layer of aluminum dust (the layer was 100 percent aluminum particles) of 30 micron particle size by inserting this layer on a platen into a laboratory furnace. No explosion occurred but the layer burned with an intense glow. From this experiment Mr. Nagy determined that the minimum temperature necessary

12/ Respondent's expert, Mr. Craven, agreed with this figure.

to burn this layer of 100 percent of aluminum dust particles, was approximately 830° C. or about 1500° F.[13/]

Based upon the testimony of C. O. Seifert and employee Feniello (Mr. Nagy had never visited Respondent's facility), Mr. Nagy opinioned that because, ". . . dust clouds were present and that ignition sources were present in the given location . . . there is a probability that an explosion will occur, could occur. An explosion is a rare event, for an explosion to occur a number of factors have to occur simultaneously, otherwise, there would be explosions everyday in the plant. For an explosion to occur, aluminum dust explosion, the aluminum dust must be dispersed, it must be dispersed in the proper concentrations and the explosible concentrations and an igniting source must be present. *** Fortunately, the probability of those events occurring simultaneously is small, - - -"[14/] (Tr. 547 - 548).

Mr. Nagy further opinioned, based on the testimony he had heard of the two witnesses identified above, who preceded his own testimony, that, ". . . there is a probability of an aluminum fire occurring. I would tend to feel that the

13/ It is significant to point out that because Respondent was prebatching numerous dust producing materials at its prebatch area, only a very minor amount being the aluminum powder, any layers of dust in that area could not have been 100 percent aluminum dust particles.

14/ In his pre-trial deposition, Mr. Nagy testified that the probability of an explosion at Respondent's plant was about one in two million (Tr. 610).

probability of an aluminum fire occurring in and around the mixing trough would be lesser than that for an aluminum dust explosion." (Tr. 548).

On cross-examination, Mr. Nagy further testified that in order to ignite an aluminum dust cloud, the source of ignition would have to be within the cloud, and that cloud would have to have a minimum concentration of aluminum dust particles, 30 micron size, of .04 ounces per cubic foot of air. Further, that he had examined the air sampling information resulting from the prior (December, 1980) OSHA industrial hygiene inspection and those samples did not identify any quantity of or indeed identify aluminum dust as part of the samples taken (Tr. 424 - 622).

Mr. Craven, Respondent's expert witness, has had a long and successful career in the industries of the United Kingdom. He was educated in Great Britain earning a "higher" National Certificate in Chemical Technology from the Manchester Institute of Service and Technology (equivalent to a B.S. Degree in this country). After service in the Royal Air Force, in 1952 he associated with the Imperial Chemical Industries and has concentrated his efforts ever since on the causes, effects and prevention of industrial explosions and fire hazards. Based upon his distinguished career in this field, approximately

five years ago he was elevated to a Fellowship in the Royal Institute of Chemistry, and is a member of the American Institute of Chemical Engineers and the Institute of Fire Engineers of the United Kingdom. He has earned the status of a Chartered Chemist, roughly equivalent to a Professional Engineer in this country.

In 1969, he joined the British consulting firm of Dr. J. H. Burgoyne & Partners, which specializes in matters related to fires and explosions, consulting with industry and insurance carriers concerning the causes and preventions thereof. He is now the Senior partner with this firm's Northern Office. During the last ten years of his career, he has personally investigated about 400 industrial fires and explosions and had been administratively involved in three times that number as a Senior Partner of his firm. He has published approximately four papers and is a lecturer at seminars held at Leeds University, the Manchester Institute, and other institutions and associations concerning fire and explosion hazards. He has consulted with industry world-wide, including plants located in Japan, Canada, Australia, the United Kingdom and United States. He has previously qualified and given testimony as an expert witness in the field of fire and explosion hazards and their prevention in the Courts of the United Kingdom, Ireland and the United States.

Before being retained for this case, he had advised the Foseco Company concerning the design of two of its plants, one in Canada, the other in Japan, concerning the explosion hazards associated with "fluidizing" aluminum powder. He explained that "fluidizing" means moving aluminum powder within a closed system by blowing air into the powder.

On October 29, 1981, after being retained in this case, Mr. Craven went to Respondent's Mt. Braddock plant, where, at the prebatching area, employees Feniello and Bukovac conducted a prebatching operation similar to the practices which they had followed prior to the February, 1981 inspection,[15/] including the emptying of the 55 gallon drum of automized aluminum powder into the aluminum trough, (a step not observed by C. O. Seifert during his inspection), and the shoveling of the powder into the metal pails. He attempted to time the period it took the small cloud of dust produced by the shoveling to settle to the ground and found the period to be one to two seconds. What cloud he did observe never drifted away from the immediate area of the pails and did not reach the furnace location or any locations near the other alleged ignition sources. After observing the prebatching operation, Mr. Craven went to the area of the furnace and removed some of the

15/ Since that time, Respondent does no prebatch aluminum powder at this facility.

insulation from the inside surface of the North wall of the building. Additionally, he took a sample of the 30 micron sized aluminum powder. After examining all of the alleged sources of ignition, (noting that the overhead, metal-clad electrical conduits were covered with a foam insulation), he proceeded to conduct two experiments outside of this building.

He took the sample of the aluminum powder and placed it on a piece of cardboard which was positioned on the exterior steps of the building which houses Respondent's laboratory at Mt. Braddock. Using a hand-held Butane gas torch, which produced a flame of about 2000 F., he directed the flame at the small pile of aluminum powder. The aluminum powder did not ignite, or glow or smoke. In fact, there was no reaction in the pile whatever. However, the cardboard around the pile of powder did burn, but the cardboard directly under the pile of powder did not burn, the powder acting as an insulator. Additionally, the flame (under pressure) did not "rouse" (cause to fly about) the small pile of powder.

Secondly, he took the piece of insulation to the laboratory at Mt. Braddock, and tried to ignite one side thereof to see if the flame would travel across the dusty surface of the insulation. It did not. He then shook the insulation over the flame, and again, none of the descending material ignited.

Mr. Craven characterized the 30 micron particle sized atomized aluminum powder used by Respondent as a very, very heavy powder having pear shaped particles, not flaked, dull grey in color, with quite a high bulk density. As mentioned previously, he agreed with Mr. Nagy that for 30 micron aluminum powder, the minimum concentration thereof in a dust cloud necessary to cause an explosion would be .04 ounces per cubic foot of air.

Further, he stated that there are four necessary elements to produce a dust explosion:

1) fuel - a combustible dust.
2) the dust must be mixed with air in quite definite proportions.
3) there must be an ignition source <u>within</u> the mixture, and
4) the cloud must be confined.

If only the first three elements occur, you might produce a flash fire, but not an explosion. In fact, he stated that there are very few substances which will explode without being confined.

Thus, he opinioned that based upon his visit to the prebatching area at Mt. Braddock, watching the prebatching operation conducted, and based upon his experiments as detailed above and his long industrial experience, that there was absolutely no possibility of an explosion of the aluminum powder as used at the Mt. Braddock prebatching area because these operations were not done within an enclosed system but rather in the ambient air and further, none of the <u>potential</u>

sources of ignition (the electric circuitry, furnace, fork-lift trucks) were close enough to the very small dust clouds produced by the prebatching operations to ignite such clouds, even assuming these clouds contained the minimum concentration of aluminum necessary to cause an explosion. (.04 02/ft.$^3$).

Furthermore, it was his opinion that there was no realistic possibility of any fire in any layers of aluminum dust in the prebatch area, (as opposed to dust clouds) because, first, as his experiment conclusively demonstrated, the 30 micron sized atomized aluminum powder is very, very difficult to ignite (he could not ignite a small pile of it using the Butane gas torch) and further, no ignition sources were near the dust layers - whatever the dust layers consisted of.

His observation of the shoveling operation lead him to conclude that it created no hazard because non-sparking, aluminum shovels were used, and the trough was not rusty but painted. Additionally, the forklift trucks, which he examined, could not be a realistic source of ignition because there never had been a report of any electrical malfunction and the exhaust manifolds did not attain a hot enough temperature to ignite any aluminum cloud (Mr. Nagy's 1500° F. would make the manifolds cherry red in color. They were not so colored when examined by Mr. Craven). Further, the electric circuit

breaker boxes were far removed from the aluminum prebatching trough, and because any aluminum clouds produced by the process were relatively heavy, and none had ever been observed migrating to these boxes, the boxes were not a source of ignition. Even if some aluminum particles could get to or into the boxes, these boxes were grounded and thus any malfunction would break these circuits. Further, after examining the overhead, metal clad electric circuitry, he observed that there was no possibility of any aluminum dust ever penetrating the foam insulation which covered these wires. Additionally, because the aluminum dust clouds were relatively heavy, there was no likelihood that any such clouds could "rouse" or migrate upward the 25 verticle feet to either the wires or light bulbs. Thus, if the wires short-circuited or a light bulb exploded, no hazard of an aluminum dust explosion would be created.

As alluded to earlier, because Mr. Craven's opinions are based upon actual observations of the entire aluminum prebatching operations as carried on at Mt. Braddock, and because he examined each alleged ignition source at this facility, and because of his actual experiments with the aluminum powder involved in this case, it is determined that his opinions of a total lack of either an aluminum dust explosion or aluminum fire hazard at the prebatch area involved must be accorded more weight than Mr. Nagy's opinions to the contrary.

## OPINION

In addition to the persuasive expert opinion of Mr. Craven alluded to above, that there was no hazards of an aluminum explosion or fire present at the prebatching area of the Mt. Braddock facility, the Citation herein must be vacated for another reason.

Items numbered 1 and 2 of the Citation herein charge a violation of the General Duty Clause of the Act, 29 U.S.C. 654(a)(1).

The elemental starting point of proving a charge under this clause is the failure of an employer to render its workplace free from "a hazard". National Realty & Construction Co., Inc., v. OSHRC, 489 F.2d 1257 (D.C. Cir., 1973); Empire-Detroit Steel Div., Detroit Steel Corp. v. OSHRC, 579 F.2d 387 (6th Cir., 1978).

A "hazard" has been defined to mean "a condition or practice in the workplace" which introduces an element of danger into the work enviornment. Empire-Detroit Steel Div., Detroit Steel Corp. v. OSHRC, supra; Pratt & Whitney Aircraft, Div. of United Technologies Corp. v. Sec. of Labor et al, 649 F.2d 96 (2nd Cir., 1981); Sec. of Labor v. Royal Logging Co. 645 F.2d 822 (9th Cir., 1981).

Thus, before one reaches the question of whether an existent hazard is "recognized" or not, the evidence must establish the existence of a hazard.

The evidence of this record does not contain sufficient evidence to support a conclusion that Respondent's prebatching of aluminum powder created a hazard of an aluminum explosion or fire.

The evidence does establish that in order to have an aluminum dust explosion, a dust cloud containing a minimum concentration of 4 ounces of aluminum particles per cubic foot of air must be present, and be ignited. During the February 5, 1981 inspection by C. O. Seifert, no air samples of any kind were taken. Thus, even if the ambient atmosphere was cloudy, which it was not, absent air samples reflecting this critical concentration of aluminum dust, an aluminum dust explosion hazard can not be established. Even if we resort to the air samples taken of this area in the earlier hygiene inspection of Industrial Hygienist Voycik, which reflected 50.85 miligrams of "silica and nuisance" dust, and label all of this dust "aluminum dust", converting this total dust sample to ounces per cubic foot, results in .00005 oz./ft.$^3$ of dispersed (aluminum) dust, one thousand times less than Mr. Nagy's critical aluminum dust concentration of .04 oz (aluminum)/ft.$^3$. This is an impermissible exercise however, because these earlier dust samples were not analyzed for aluminum content, if any.

Furthermore, although Respondent frankly admits that the prebatching area was a "dusty" area, C. O. Seifert took no samples of the dust he observed during his February inspection, i.e., wipe samples.

The evidence establishes that numerous dusty materials other than the aluminum powder were prebatched in this area. In fact, the resin materials (very dusty) were prebatched in this area and constituted the single largest volume of material handled, where as the aluminum powder constituted a minor and very small volume of material handled. Thus, absent an analysis of the dust observed in this area, there simply is no possible way to conclude what portion of the dust observed on the building structures and stored material, if any, consisted of aluminum dust.

Because of these elemental and critical voids in the evidence of this record, the Complainant has failed to establish that any hazard of an aluminum dust explosion or fire was caused by Respondent's prebatching operations at its Mt. Braddock facility.

Therefore, Items numbered 1 and 2 of the Serious Citation must be vacated.

The remaining Items (numbered 3 through 6) of the Citation herein also must be vacated because the duty of complying with the cited standards is predicated upon the

existence of a hazardous workplace environment. Since the Complainant has failed to establish such an environment at Respondent's prebatching facility, these Items similarly must be vacated.

## CONCLUSION

The jurisdiction of the Review Commission in this case is not contested and is established by the pleadings and Stipulations pursuant to Sections 3(3), 3(5) and 10(c) of the Act, 29 U.S.C. 652(3), 652(5) and 659(c).

Based upon the foregoing which constitutes the findings of fact and conclusions of law herein, and pursuant to Sections 10(c) and 12(j) of the Act, 29 U.S.C. 659(c) and 661(i), it is hereby,

ORDERED:

That the six Itemed Serious Citation issued to the Respondent herein on March 9, 1981, and the penalties proposed thereon, are VACATED.

## NOTICE OF DECISION

Secretary of Labor v. Panelmasters International, Inc.
OSHRC Docket NO. 81-1567

1. Enclosed is a copy of my decision. It will be filed with the Commission on June 28, 1982, and will become the final order of the Commission on 7-28-82, unless a Member of the Commission directs that it be reviewed.

2. You may petition for discretionary review of this decision by the Commission. A petition may be filed directly with me within twenty (20) days from the mailing of my decision. Thereafter, a petition should be mailed to the Executive Secretary, Attention:

   Chief Review Counsel
   Occupational Safety and Health Review Commission
   1825 K Street, N.W., Suite 601
   Washington, D. C. 20006.

   Any petition filed directly with the Commission will be considered to the extent that time and resources permit. The last day the Commission may consider your petition is 7-28-82. This final order date is fixed by law and cannot be extended under any circumstances.

3. If review is ordered by a Member of the Commission, each party to this case will be notified. In addition, each party will be given an opportunity to submit a brief to the Commission.

4. Please complete the enclosed postcard indicating whether you presently intend to seek review of this decision and mail the completed card promptly. Your response does not bind you in any way, but it assists the Commission in processing your petition when it is filed.

5. For any further details on the review process, see Commission Rules 90, 91, 92 and 93.

|---|---|
| SECRETARY OF LABOR,<br><br>Complainant,<br><br>v.<br><br>PANELMASTERS INTERNATIONAL, INC.,<br><br>Respondent. | OSHRC DOCKET NO. 81-1567 |

DECISION AND ORDER

Appearances: Marigny A. Lanier, Esq., of Dallas, Texas, for the complainant.

This matter came on regularly for hearing, pursuant to notice, at Houston, Texas, but the respondent, Panelmasters International,Inc., ("Panelmasters") did not appear. Thereupon, the Secretary of Labor ("the Secretary") moved for default judgment. The hearing was recessed for counsel for the Secretary to telephone Panelmasters, after which she reported that she was informed by Panelmaster's president, W.R. Kendrick, that Panelmasters was in bankruptcy and that, on advice of counsel, he would not attend the hearing.

The file reveals that from April 30, 1981, to May 14, 1981, Panelmaster's workplace at 3026 Berry Road, Houston, Texas, was inspected by a compliance officer of the Occupational Safety and Health Administration ("OSHA"), and as a result of this inspection two citations were issued May 20, 1981, charging Panelmasters with serious and nonserious violations of Section 5(a)(2) of the Occupational Safety and Health Act of 1970 ("the Act") and certain safety

regulations promulgated thereunder. Panelmasters timely filed notice of contest June 16, 1981, but failed to post same as required by the Act for the benefit of affected employees. Panelmasters ignored a Posting and Service Order from the Executive Secretary of the Occupational Safety and Health Review Commission ("the Commission") dated September 23, 1981, and an Order to Show Cause by Chief Judge Paul A. Tenney, dated the same date. On October 27, 1981, Judge Tenney entered an order dismissing the notice of contest except insofar as it pertained to the proposed penalties totalling $ 840. The case was referred to the undersigned November 19, 1981, for a determination of the appropriate penalties.

Thereafter the case was set for hearing, but the setting was cancelled after the parties informed the undersigned that the case was settled. It was rescheduled May 18, 1982, at 1:00 p.m., due to Panelmasters' failure to execute and return the proposed settlement agreement. The default previously related then ensued.

It is apparent that Panelmasters has been given ample opportunity to litigate this case but has failed and refused to do so. It is therefore ORDERED that:

Judgment by default is entered against the respondent, Panelmasters International, Inc., for penalties totalling $ 840 as proposed by the Secretary for the violations for which it was cited May 20, 1981.

## DECISION AND ORDER

Ditore, J.:

## PRELIMINARY STATEMENT

Respondent contested a citation for a serious violation of 29 CFR § 1926.28(a) and the $350.00 penalty proposed for the alleged violation. During the course of the hearing, held on April 1, 1982, at New York, New York, Complainant, by motions which were granted, withdrew standard 29 CFR § 1926.28(a) and substituted in its place, standard 29 CFR § 1926.451(u)(3).

## ISSUES

1. Whether Respondent on October 6, 1981, violated standard 29 CFR § 1926.451(u)(3), at its workplace.

2. If it did, whether any of Respondent's employees were exposed to the hazard created by the violation.

3. If employees were exposed, whether the violation was serious.

4. If it was serious, whether the proposed penalty is proper and reasonable.

## STATEMENT OF THE EVIDENCE

On October 6, 1981, Compliance Officer Daniel Marra, of the Occupational Safety and Health Administration, inspected a worksite at 154th Place and Riverside Drive, College Point, Queens, where two-story duplexes were under construction. On the pitched roof of one of the buildings, Officer Marra observed two of Respondent's employees doing roofing work. The two workers were about four to five feet (estimated) from the edge of the roof (T. 11, 13, 14, 16, 21, 47; Exh. C-1).

The workers descended from the roof at the request of Officer Marra, who then explained to them the fall hazard they were exposed to while working on the pitched roof without life belts and lifelines. The employees stated that this was the way they always worked. They had no safety belts and lines and

never used any because they feared that would become entangled in the lines. They did have roof brackets which they used on roofs with steeper slopes (T. 21, 25, 26, 27, 49, 50). Officer Marra also spoke with Respondent's secretary, Mr. Kleinfield and with Respondent's job superintendent, John Lacondo. Both men told Officer Marra that their employees would not go back to work on the roof until safety belts were provided (T. 28, 29).

Officer Marra estimated the fall distance from the edge of the pitched roof to be 24 feet. He made no actual measurement. He also stated that the pitch of the roof was five feet in twelve feet or about a 25-degree pitch. He did not know of his own knowledge what the pitch was. He made no measurements to determine the pitch, nor did he consult the building plans. He based his pitch figure on what was told to him by the job superintendent for the general contractor, and believed the job superintendent obtained the information from the construction plans (T. 18, 19, 22, 23, 24; Complainant's brief pp. 2, 4).

On October 7, 1981, Officer Marra returned to the worksite. He did not observe any of Respondent's employees working on any roof but did observe them on the ground wearing life belts. He never asked them how they tied off their life belts (T. 30, 53, 91).

Officer Marra at the hearing, and at an informal conference with Respondent's representatives after the citation was issued,

stated that the violation could be abated by the use of life belts and lifelines with four possible methods for securing the lifelines (T. 33-36, 53, 54-71, 76).

During the course of his duties as a compliance officer, Marra inspected twelve roofs which were flat and not pitched. He never saw any of the abatement methods he suggested used on any roofing operation (T. 45-46, 54). At the informal conference between Respondent's representatives and OSHA's representatives, Respondent maintained that the methods of abatement suggested by Officer Marra and the further suggestions by OSHA, for the use of catch platforms and scaffolding, were not feasible (T. 36, 39, 73, 76).

Officer Marra admitted at the hearing, that standard 29 CFR § 1926.451(u)(3) was the better standard but did not cite Respondent under that standard. He was concerned about immediate abatement and believed it was easier and feasibly quicker to use life belts and lines than build catch platforms as required by 29 CFR 1926.451(u)(3) (T. 43, 44).

At the conclusion of Officer Marra's testimony, Complainant moved, pursuant to Rule 15(b) of the Federal Rules of Civil Procedure, to amend the citation and complaint to allege in the alternative, a violation of 29 CFR § 1926.451(u)(3). Respondent objected to the motion. The motion was granted with the understanding that the Court would grant Respondent a continuance

to prepare its defense to the added charge. Respondent refused the offer and elected to go forward with the case (T. 93, 98, 100, 101).

Complainant called Compliance Officer Raymond Swanson as his next witness. Officer Swanson was qualified as an expert occupational safety and health officer who had experience with pitched roofs. Officer Swanson did not inspect the worksite and his knowledge of the case was obtained from the testimony of Officer Marra, which Swanson heard during the hearing (T. 100-101, 102-109, 111-112), 121).

Based on the testimony of record, Officer Swanson testified that in his expert opinion the use of life belts and lifelines were not feasible on the roof where Respondent's employees were working, and that if life belts and lines were used, they might create a greater hazard (T. 113, 117, 119, 124).

Officer Swanson further stated that if he had inspected the worksite, he would have recommended the use of catch platforms as required by 29 CFR § 1926.451(u)(3) if the pitch of the roof was greater than four inches in twelve inches, or scaffolding if the pitch was four inches in twelve inches or less. In deciding which protective means should apply, Officer Swanson would have read the building plans and would have taken actual measurements to determine the pitch of the roof (T. 113, 129, 130-131).

Complainant rested at the end of Officer Swanson's testimony. Respondent moved to dismiss the citation and complaint, as amended. Decision was reserved on the motion and both sides rested (T. 135, 141-142). Prior to the conclusion of the case, Complainant moved to withdraw that part of the citation and complaint which alleged a serious violation of 29 CFR § 1926.28(a). The motion was granted and decision reserved on that part of Respondent's prior motion relating to 29 CFR § 1926.451(u)(3) (T. 142).

## OPINION

The unrefuted evidence in Complainant's direct case establishes that on October 6, 1981, Respondent was the roofing subcontractor at a worksite in Queens, New York; that two of Respondent's employees were working on a pitched roof at the worksite; that the two employees were about four to five feet from the edge of the roof and were exposed to a fall hazard of approximately 24 feet; and that the two men were not protected from the hazard by either life belts and lines, or any other protective device.

Respondent was initially charged in the citation and complaint, with a serious violation of 29 CFR § 1926.28(a) for its alleged failure to protect its employees from the fall hazard by means of safety life belts and lines. This standard and the life belt and lifeline issue emanating from it, were removed

from the case by Complainant's withdrawal of the standard and the issues relating to it. Complainant during the hearing, elected to proceed on the alternate charge of a serious violation of 29 CFR § 1926.451(u)(3) which requires the use of catch platforms.

Section 1926.451(u)(3) provides as follows:

> (u) Roofing brackets
>
> (1) . . .
>
> (2) . . .
>
> (3) A catch platform shall be installed below the working area of roofs more than 16 feet from the ground to eaves with a slope greater than 4 inches in 12 inches without a parapet. In width, the platform shall extend 2 feet beyond the protection of the eaves and shall be provided with a guardrail, midrail, and toeboard. This provision shall not apply where employees engaged in work upon such roofs are protected by a safety belt attached to a lifeline.

The only issue remaining is whether Respondent on October 6, 1981, violated section 1926.451(u)(3) at its worksite. This determination, since Respondent rested at the end of Complainant's case, is dependent on whether Complainant carried his burden of proof to establish, by a preponderance of the evidence, that Respondent was in violation of the standard.

The evidence establishes that the height from ground level to the eaves of the roof was greater than 16 feet; that the employees were not protected by safety belts and safety lines;

and that there was no parapet at the roof (see Exh. C-1). The one remaining element to be established before a violation can be found, is whether the slope or pitch of the roof was greater than 4 inches in 12 inches. The only evidence as to this element came from the uncorroberated hearsay statement given by Officer Marra, that he was told by the general contractor's job superintendent that the pitch was 5 feet in 12 feet.* Officer Marra had no personal knowledge of his own concerning the pitch of the roof, nor did he make any measurements of his own.

The Commission has held that hearsay statements are admissible in administrative hearings and may have probative value Secretary v. Hurlock Roofing Co., 7 BNA OSHC 1867, 1979 CCH OSHD ¶ 24,006 (No. 14907, 1979), Secretary v. Ultimate Distribution Systems, Inc., 10 BNA OSHC 1565 (No. 79-1269, 1982).

The Commission has also held that uncorroborated hearsay is insufficient to establish a violation. Secretary v. Paramount Plumbing & Heating Company, Inc., 5 BNA OSHC 1459, 1461, 1977-78 CCH OSHD ¶ 21,820 (No. 12652, 1977).

---

*Respondent objected to the introduction of this hearsay statement (T. 18). The objection was overruled and the statement admitted on the ground that Complainant's counsel represented he would, through Officer Marra, elicit how the information was obtained by Officer Marra through conversations he had with those supervising the worksite (T. 18-19). No further evidence was elicited on this issue except a repetition of the previous testimony from Marra that he received the information from the general contractor's job superintendent whom he believed consulted the building plans (T. 23-24).

Although the precise measurement of the pitch or slope of the roof was not a necessary element under the original section 1926.28(a) charge, it is an essential and necessary element to the charge that Respondent violated section 1926.451(u)(3). It is Complainant's burden to establish this element of the violation by preponderant evidence which is not only admissible but which has probative value. Complainant's proof on this element was only the hearsay statement of Officer Marra, and is insufficient to meet his burden of proof.

There are no grounds in this record upon which this Court can evaluate the truthfulness of the hearsay statement; nor is the hearsay statement more probative than the evidence of the maker of the statement whom Complainant, with reasonable efforts, could have produced for examination. Finally, to deprive Respondent of its crucial and valuable right of cross-examination on a vital issue of the case, is neither in the interests of justice or within the intent of the Act. For the reasons given, the hearsay statement is accorded no weight.

Respondent's motion made at the end of Complainant's case to dismiss the citation and complaint, as amended, is granted.

The specific findings of fact are set forth in this Opinion.

## CONCLUSIONS OF LAW

1. Respondent is, and at all times material herein was, engaged in a business affecting commerce within the meaning of section 3(5) of the Act (29 U.S.C. § 652(5)).

2. The Occupational Safety and Health Review Commission has jurisdiction over the subject matter and parties to this action.

3. On October 6, 1981, Respondent was not in violation of 29 U.S.C. § 654(a)(2) for failing to comply with 29 CFR § 1926.451(u)(3).

## ORDER

Due deliberation having been had on the entire record, it is hereby

ORDERED that amended citation (No. 1) for a serious violation of 29 CFR § 1926.451(u)(3) and the proposed penalty of $350.00, are vacated.

OCCUPATIONAL SAFETY AND HEALTH ADMINISTRATION

| | |
|---|---|
| SECRETARY OF LABOR,<br>Complainant,<br>v.<br>MAJESTIC WILEY CONTRACTORS LIMITED,<br>Respondent. | OSHRC DOCKET NO. 81-2545 |

APPEARANCES:

For the Complainant:
Keithley F. T. Lake, Esquire, of Kansas City, Missouri

For the Respondent:
John D. O'Reilly, Esquire, of Framingham, Massachusetts

DECISION AND ORDER

Child, R. M. Judge, OSHRC:

Statement of the Case

This matter is before the Occupational Safety and Health Review Commission (the Commission) pursuant to section 10(c) of the Occupational Safety and Health Act of 1970, 29 U.S.C. §651 et seq., (the Act). Complainant seeks affirmance of item 1 of Serious Citation No. 1,[1/] issued

1. The alleged violation and the standard:

Citation

1.
29 CFR 1926.250(b)(9): Cylindrical material was not stacked and blocked so as to prevent rolling off the blocking:
Sections of 42" pipe, used for the new gas transmission line northeast of Zeeland, North Dakota, were not blocked to prevent rolling off the blocking or skids.

Standard

29 CFR 1926. Subpart H Materials Handling, Storage, Use, and Disposal
§1926.250 General requirements for storage.
* * *
(b) Materials storage
* * *
(9) Structural steel, poles, pipe, bar stock and other cylindrical materials, unless racked, shall be stacked and blocked so as to prevent spreading or tilting.

to respondent October 23, 1981, and of a proposed penalty in the sum of $700.00.

The matter came on for hearing before the undersigned judge at Bismarck, North Dakota, on April 6 and 7, 1982. Except as they may have been called as witnesses, there was no appearance by or on behalf of affected employees.

The parties have filed post-hearing briefs and the complainant has included proposed Findings of Fact and Conclusions of Law. To the extent said proposed Findings and Conclusions are consistent with this decision, they are adopted; to the extent they are inconsistent with those set forth herein, they are rejected. Jurisdiction is not an issue (Answer). The amount of the penalty is not contested. (Tr. 142)

The issues to be determined are:

1. Is enforcement of the citation precluded under Section 4(b)(1) of the Act?

2. Was the respondent in violation of the standard at 29 C.F.R. 1926.250(b)(9)?

## Findings of Fact

Respondent is a pipeline construction contractor. Among its various projects is a "spread" in North Dakota which is a ninety-two mile portion of the Alaskan Pipeline. The eventual purpose of the pipeline is to transmit natural gas from Alaska to distribution points in the United States.

On the project in question respondent is a sub-contractor to Northern Border Pipeline Company. Under its contract respondent is responsible for the entire construction of the pipeline along the "spread." A separate sub-contractor, to wit: Trans-Eastern Inspection Service (Trans-Eastern) is responsible to Northern Border Pipeline Company for pipeline inspection and X-ray inspection of the welds and joints along the line.

The pipeline being constructed was of heavy gauge steel, 42" in diameter, and weighed 318 pounds per square foot. Each forty-foot length of this pipe weighed 22 tons. (Tr. 237)

Respondent's construction of the pipeline proceeded in the following steps: A right of way crew would clear the growth, make cuts and level the ground. A trenching crew would then excavate the ditch. Next the stringing crew delivers the pipe in 80-foot lengths from the yard and places it on the ground along the length of the trench and usually 8' to 10' from the edge. A bending crew then shapes the pipe to accommodate dips or rises in elevation and changes in direction. After the bending crew has passed, a pipe gang lifts the pipe off the ground, sets it on "skids" and accomplishes the first three welding passes. Next a firing line makes the final five welding passes. A tape crew then coats and wraps the pipe and lowers it into the trench. The trench is filled in and the area cleared. Once an employee is assigned to one of the crews, he is fairly well fixed in that position for the duration of the project. (Tr. 306-311)

Generally, the X-ray inspection of the welds is accomplished after the pipe crew and the firing line has passed and before the tape crew arrives. At the time of the incident giving rise to the inspection and issuing of the citation herein, the tape crew of respondent was about 3,000 feet behind and the pipe crew of the respondent was about 5 or 6 miles ahead of the X-ray re-shot crew of Trans-Eastern. (Tr. 312)

Skids are constructed on the scene by the pipe crew of pieces of oak lumber (skid members) approximately 5" x 7" x 48" in dimension laid crosswise in such fashion as to form a crib or pile. (Exhibit C-6) The

function of the skid is to support the pipe off the ground to facilitate welding, X-ray and coating. Skids can be from 6 inches to two feet high depending on the terrain and generally would keep a weld about 18 inches off the ground. (Tr. 292, 293) Generally, one skid is placed per joint unless the terrain calls for more. Here the pipe was in 80-foot lengths and the skids were placed every 75 or 80 feet. (Tr. 294) There was no evidence that the terrain called for more.

The start joint was crotched, and every 5th to 7th skid pile was crotched as is generally the procedure followed in the industry. (Tr. 291) Crotching is accomplished by inserting members into the skids from positions lateral to the pipe in such a manner as to resist sideward movement or rolling of the pipe. (Exhibits C-7 and C-8; Tr. 292-295, 378-380 and 408-413)

It is normal for a pipeline sitting on skids to "crawl." That is, temperature changes resulting in contraction and expansion of the steel can cause the pipe to move as much as 18 inches on the skids. (Tr. 297-298) After the pipe has rested on the skids for a while it is not unusual to see broken members in the skid piles. (Tr. 295) After the pipe is put in the ground the skid members are gathered up. The broken members are not re-used, but are taken to the dump while the remaining members are taken to the front end of the pipeline construction for re-use by the pipe gang. (Tr. 264, 320)

The skids are inspected frequently for integrity. If a member was broken, but the skid pile appeared stable, no action would be taken. If a broken member appeared to affect the stability of the skid pile or if the configuration of the skid pile had altered so as to become ineffective, the skid pile would be reconstructed. (Tr. 322, 332)

In inspecting the pipeline you could sometimes go a mile and see no broken members; another time you might see two broken skid members within a mile. (Tr. 323)

The space between the pipe and the trench is known in the industry as no-man's-land. Employees are told: "If you get over there, do it with extreme caution." When X-ray crews are working they usually avoid working in no-man's land by throwing the tape across the top of the pipe and fishing it back under the pipe with a hook. X-ray crews generally place signs to keep workers and personnel 50 to 75 feet away from X-ray operation in order to avoid radiation. (Tr. 416, 417, and 438-439)

On many occasions Trans-Eastern, the subcontractor to Northern Border Pipeline Company charged with inspection of the welds, would have need to do isolated re-shots to double check a suspect weld or because of difficulties in developing the original shots. Trans-Eastern would indicate to respondent a section of the pipeline which it wanted to re-shoot. Respondent would then perform a bevel cut at the weld at either end of the section of pipe indicated by Trans-Eastern. A bevel cut would in effect remove the pipe approximately 4 inches either side of the weld, leaving a gap of about 8 or 9 inches in the pipeline at either end of the section where the X-ray re-shots are to be performed. Respondent's personnel and equipment would then move the ends of the pipe facing the bevel weld in order to provide an opening and the placing inside the pipe of a remote controlled X-ray machine weighing approximately 80 pounds. (Tr. 301-305, 331)

---

At the request of Trans-Eastern, respondent caused bevel cuts to be made on two sections of the pipeline standing on skids during the morning of October 6, 1981. (Tr. 329) (This case concerns one of those two sections of the pipeline, which is described by various witnesses and at points in the record as being 800 feet long (Tr. 26, 36) or 934 feet long, (Respondent's Requests for Admissions and Complainant's Response thereto) or 880 feet long. (Tr. 328) The actual length of the section in question is not of particular consequence. Said section will hereafter be referred to as section X.)

In the afternoon of October 6, 1981, Gary Van Syoc, head of the two-man X-ray re-shot crew, came to where the taping crew was working and requested of William Pedigo, its foreman, that the ends of Section X be moved in order to provide the necessary opening for the X-ray machine. The taping crew on that afternoon was working on the pipeline approximately 3,000 feet southerly of Section X. (Tr. 351, 382)

Mr. Pedigo sent a Caterpillar side boom tractor with operator, Kurt Osterreich, and a laborer, Floyd Aure, from the taping crew to Section X. About 45 minutes later, Mr. Pedigo went to Section X where he observed at the southerly end of that section the tractor boom holding the pipe under the end of which Floyd Aure and Mr. Syoc of Trans-Eastern were fixing the skids for the pipe end to rest on in its new position closer to the trench. Two sets of skids had been moved in order to place the pipe end in this new position. (Tr. 352-357, 374)

Mr. Pedigo, Mr. Aure and the tractor and its operator then went to the north end of section X where they moved the end of the pipe away

from the trench and set it close to the ground held in that position by a ground crotch. The X-ray technician, Mr. Syoc, requested the end of the pipe be placed that way in order to better get his X-ray machine into the pipe. (Tr. 357-358)

The tractor traveled and operated and after completing the movement of the ends of section X was parked at the side of the pipeline away from the trench. (Tr. 403) Mr. Pedigo, Mr. Aure and Mr. Osterreich returned to their work with the taping crew by truck. (Tr. 364, 390)

After returning to their work with the taping crew, Floyd Aure, Kurt Osterreich and William Pedigo remained there working about 3,000 feet from section X until about 45 minutes later, when they learned that section X had rolled into the trench. (Tr. 366-367; 391-392) An employee of Trans-Eastern, member of the X-ray crew, was trapped in the ditch and fatally injured by the falling pipe. Mr. Van Syok, the X-ray technician employed by Trans-Eastern, was also injured. (Tr. 138, 140)

It rained at the worksite during the week preceding October 6, 1981, and .43 inches of rain was measured nearby during the period Sunday night through Monday, October 5, 1981, at 4:00 p.m. On October 6, 1981, winds in the vicinity were gusting from the northwest to 40 mph. There was a five to six degree temperature drop mid-afternoon on October 6. (Tr. 200)

## Discussion

Issue 1: Respondent urges that it is exempt from the provisions of the Act by reason of Section 4(b)(1) thereof. Since it was engaged at all

times in the construction of a natural gas pipeline it claims the Natural Gas Pipeline Safety Act of 1968, 49 U.S.C. §1671 et seq., (Pipeline Safety Act) to preempt the field of regulating the activity in which it was engaged.

It has been determined by the Commission that the Pipeline Safety Act governs individuals engaged in the transportation of gas or in the operation of pipeline facilities, but that it does not cover persons who are contractors engaged in construction or repair of natural gas pipelines or facilities. Texas Eastern Transmission Corp. and Sinapp Co., 1975-76 OSHD 23,899 (1975).

Respondent is here found not to be exempt from the requirements of the Act.

Issue 2: In order to prove that an employer has violated a standard promulgated pursuant to section 5(a)(2) of the Act, the complainant must show (1) the cited standard applies to the facts, (2) there was a failure to comply with the cited standard, (3) employees had access to the violative condition, and (4) the cited employer knew or could have known of the hazardous condition with the exercise of reasonable diligence. Daniel International Corp., 9 BNA OSHC 2027, 1981 CCH OSHD 25,813 (No. 76-181, 1981); Prestressed Systems, Inc., 9 BNA OSHC 1864, 1981 CCH OSHD ¶25,358 (No. 16147, 1981).

(1)

By its terms the cited standard applies only to materials in "storage." Eighty-foot lengths of 42" diameter steel pipe were laid on the ground end to end at the trench site. Perhaps up to that point the lengths of pipe could still be said to be in storage. However, those lengths of pipe were welded together and on the days covered by the inspection and prior had become no longer lengths of "pipe" or "cylindrical material", but

rather one continuous pipeline. On October 6, 1981, a section of that pipeline was cut for inspection of its welds. That section was in excess of 800 feet long and could not be referred to as material in storage. In fact, at the moment it rolled, an X-ray crew was completing the final shot of a series of X-rays taken from within the pipeline section.

Even if one were to allow that an 800-foot section of pipeline temporarily separated from its greater whole was "material in storage," it must readily appear that it was not "racked" as contemplated in 29 C.F.R. 1926.250(b)(9). Since it was not racked the standard, if it applied, required such cylindrical material to be ". . . stacked and blocked so as to prevent spreading or tilting." Here it was manifestly impossible to stack one 800-foot plus section of pipeline. Furthermore one pipeline cannot "spread" nor can a flexible metal pipe 800 feet long or more "tilt" when its entire length rests on supports within two feet of the ground.

The standard which respondent was cited as having violated does not apply to the facts of this case. See Whitcomb Logging Company, OSAHRC Docket No. 1323, 2 OSHC 1419 (1974) and Sierra Construction Corp., OSAHRC Docket No. 13638, 6 OSHC 1278 (1978).

Assuming, however, that the standard were held to apply, complainant has nonetheless failed to meet his burden of proving the remaining elements of a Section 5(a)(2) violation of the Act.

(2)

As a result of the fatality complainant conducted an inspection of respondent's project worksite on October 8 and 9, 1981. The compliance

officer (C.O.) determined that there had been twelve skids under section X. (Tr. 47, 48, 63) However, by reason of the movement of the pipe, said skids were in such a state of disarray that he was unable to determine what their condition was before section X rolled. (Tr. 66; Exhibits C-1 through C-5) Since the same crew had constructed all of the skids, the C.O. looked at the skids under the pipeline immediately north and south and from which section X had been cut in order to determine the construction of the skids which had supported section X before it rolled. (Tr. 64) Complainant claims an inference of improper shoring beneath section X arising from evidence of inadequate skids and crotches beneath the pipe standing on skids immediately adjacent thereto. It is the position of complainant that the alleged improper skidding and crotching of section X serves as the basis for the citation which was issued. (Tr. 98; 161, 220)

Complainant put in evidence photographs of what it claimed to be inadequate skids and crotches observed under the pipe north and south of section X. (Exhibits 6 through 14). At least two of said exhibits were photographs of the same skid pile. (Exhibits 7 & 9; Exhibits 12 & 14)

Respondent's witnesses denied that the conditions depicted in the photographs rendered the skids or crotches inadequate to meet the needs for which they were constructed. (Tr. 418-426)

Mr. Pedigo testified that there were no broken meembers nor anything unusual in the four new skids constructed in the course of moving the two ends of section X. (Tr. 360-361) He further testified that in addition to the ground crotch which he placed at the north end, there were two additional crotches under section X; one about 260 feet from the south end and one about 300 feet from the north end. (Tr. 364) The X-ray crew made no comments regarding the skids, and in traveling slowly

in his truck up and back the full length of section X he looked at the skids and observed no deficiencies in the skid piles under section X. (Tr. 361-62, 371) Mr. Pedigo set skid piles and crotches for seven years as a laborer. (Tr. 371)

The side boom tractor operator testified that he watched while the new skids were erected at either end of section X and while he lowered the pipe onto the new skids. He observed no loose or broken members nor anything unusual. (Tr. 386-90) When asked by counsel for complainant he said he saw nothing unusual about section X, and when asked by counsel for complainant for his opinion as to the manner in which this pipeline was crotched and skidded said " . . . it was skidded at least as good as anything I've been on or better . . . was probably the best job I've ever seen skidding." (Tr. 393, 394)

Finally, uncontroverted testimony of Joe Walters, respondent's job superintendent, was to the effect that in inspecting the skids you could sometimes go a mile and see no broken members and again you may see two broken members within a mile. If one could go a mile and see no broken members, one could certainly expect not to see any in a lesser distance.

The inference relied upon by the complainant is without merit and, if indulged, falls when confronted by direct evidence that the skids and crotches under section X were without structural defect.

Complainant has failed to meet its burden of proving that the respondent failed to comply with the cited standard.

(3)

No evidence was presented that any employee of respondent at any time entered the area referred to as no-man's-land. That area would be

particularly hazardous where the ditch was as wide as it had to be to accommodate this 42-inch pipe.

The C.O. observed no employees exposed to the hazards he claimed to be presented by the alleged inadequate skids or crotches shown in the photographs. (Tr. 161) He did, however, testify that Floyd Aure, an employee of respondent, told him in the course of the inspection that he had to run twenty feet to escape the rolling section X. (Tr. 138)

Mr. Aure was not called as a witness. Mr. Pedigo, foreman of the tape crew in which Mr. Aure worked, and Mr. Osterreich, operator of a tractor within that crew, both testified. Each testified that Mr. Aure had returned with them to the tape crew operation 3,000 feet south of section X after completing the movement and re-skidding and crotching of its ends. Each testified that Mr. Aure remained with them and the tape crew until they learned that section X, which was 3,000 feet away from where they were working, had rolled into the trench. The Compliance Officer's hearsay testimony gives way to the direct testimony of Mr. Pedigo and Mr. Osterreich which was in opposition thereto.

Complainant failed to meet his burden of proving employee exposure.

(4)

Complainant has proved that the skids depicted in the photographs were in the conditon shown. Complainant has placed in evidence photos of each skid or crotch it claimed to be defective. Some of these photos proved to be duplicates of the same pile. At least one of these piles, objected to by the complainant, was out of service since the pipe end had been placed on the ground deliberately. (Tr. 346)

Complainant's witnesses, to wit the Compliance Officer and the Assistant Safety Director of the North Dakota Workmen's Compensation Bureau, had

no experience prior to this incident in the inspection or the construction of pipelines and no knowledge of skidding and crotching procedures prior to this inspection. (Tr. 142) Little credibility can be attached to their opinion and testimony that the skids objected to were in fact hazardous.

Since respondent assumed the task of frequently inspecting the skids and crotches in service along the pipeline, it knew of the condition of which complainant complains. However, respondent's witnesses are given greater weight in their testimony as to the absence of hazard accompanying the conditions objected to by the complainant and shown in the photographs. (Tr. 418-26)

It was the testimony of Donald E. Foster, construction consultant with extensive pipeline construction experience over a 36-year period, that it would be possible for a pipeline properly crotched and skidded to roll if subjected to temperature change, wind conditions and employee actions attendant upon X-ray procedures. (Tr. 434)

The Assistant Safety Director for the North Dakota Workmen's Compensation Bureau appearing as a witness for the complainant in filing his written report listed as mechanical or physical conditions associated with the cause of the accident: (1) Soft ground due to rain (possible), (2) Pipe being buffeted by high winds (probable), and (3) Very heavy material (pipe) having the potential of uncontrolled movement.

Complainant failed to meet its burden of proof that respondent knew of a hazardous condition.

Having considered the Citation, the Notice of Contest and the pleadings herein; and having considered the Exhibits received in evidence and the testimony of the witnesses and having weighed the credibility

thereof; and having considered the post-hearing submittals of the parties; and having made and entered Findings of Fact, there are hereby entered the following:

## Conclusions of Law

1. Respondent is not exempt from the requirements of the Act.

2. The standard at 29 C.F.R. 1926.250(b)(9) does not apply to the activity of the respondent of which complainant complains.

3. Complainant failed to meet its burden of proof that the respondent failed to comply with the standard at 29 C.F.R. 1926.250(b)(9).

4. Complainant failed to meet its burden of proof that employees were exposed to a hazard.

5. Complainant failed to meet its burden of proof that respondent knew of a hazardous condition.

6. Item 1 of serious Citation No. 1, issued to respondent October 23, 1981, should be vacated, as should be the proposed penalty therefor.

## ORDER

Item 1 of serious Citation No. 1, issued to respondent October 23, 1981, is VACATED as is the penalty proposed therefor.

# OCCUPATIONAL SAFETY AND HEALTH REVIEW COMMISSION

## NOTICE OF DECISION

Secretary of Labor v. ADAMS COUNTY ROOFING, INC.
OSHRC Docket No. 80-5618

1. Enclosed is a copy of my decision. It will be filed with the Commission on July 12, 1982, and will become the final order of the Commission on August 11, 1982, unless a Member of the Commission directs that it be reviewed.

2. You may petition for discretionary review of this decision by the Commission. A petition may be filed directly with me within twenty (20) days from the mailing of my decision. Thereafter, a petition should be mailed to the Executive Secretary, Attention:

   Chief Review Counsel
   Occupational Safety and Health Review Commission
   1825 K Street, N.W., Suite 601
   Washington, D.C. 20006.

   Any petition filed directly with the Commission will be considered to the extent that time and resources permit. The last day the Commission may consider your petition is August 11, 1982. This final order date is fixed by law and cannot be extended under any circumstances.

3. If review is ordered by a Member of the Commission, each party to this case will be notified. In addition, each party will be given an opportunity to submit a brief to the Commission.

4. Please complete the enclosed postcard indicating whether you presently intend to seek review of this decision and mail the completed card promptly. Your response does not bind you in any way, but it assists the Commission in processing your petition when it is filed.

5. For any further details on the review process, see Commission Rules 90, 91, 92, and 93.

APPEARANCES:

Jerry R. Atencio, Esquire, of Denver, Colorado,
for Complainant

Forrest E. Clark, Jr., Esquire, of Denver, Colorado,
for Respondent

DECISION AND ORDER

Quentin P. McColgin, Administrative Law Judge:

This is a proceeding under §10(c) of the Occupational Safety and Health Act of 1970 (the Act), 29 U.S.C. §659(c) involving an alleged violation of §5(a)(2) of the Act, 29 U.S.C. §654(a)(2).[1/]

This matter arose out of an accident investigation of respondent's workplace, located in Denver, Colorado. As a result of that investigation, respondent was issued a citation charging it with a single violation of a safety standard. Respondent duly contested the citation. Thereafter, a complaint and answer were filed by the parties. In its

---

1/ "Each employer--shall comply with the occupational safety and health standards promulgated under this [Act]."

answer respondent admits the allegations contained in the complaint, that it is engaged in a business affecting commerce, and that it is an employer within the meaning of the Act. A hearing was held in this matter January 30, 1981, in Denver Colorado. No appearance was made at such hearing on behalf of the affected employees. At the conclusion of the hearing, parties waived closing argument reserving the right to file briefs. The parties were afforded an opportunity to file briefs; however, neither did so.

Having heard and observed the witnesses and having considered the testimony and other evidence together with the pleadings and arguments presented in this matter, the undersigned hereby issues the findings, conclusions, and order set forth in this decision. To the extent that there are any pending motions that have not been specifically granted herein, such motions are denied.

## Findings of Fact

1. Respondent employs from 26 to 30 persons in its various operations. (Tr. 36)

2. On August 6, 1980, three of respondent's employees were preparing to install insulation and roofing on the roof of a two-story, flat-roofed building being constructed in Denver, Colorado. (Tr. 19, 63)

3. The building comprising respondent's worksite was H-shaped, with the south portion connected at roof level with the north portion by a walkway. (Tr. 100-01)

4. Respondent's employees had access to the south portion of the building at roof level (south roof). (Tr. 60) Respondent's employees did not have access to the north portion of the building at roof level. (Tr. 88)

5. On August 6, 1980, three of respondent's employees were engaged in stacking insulation, two of whom were working on the south roof. (Tr. 56)

6. The roof of the building was twenty-two feet above the concrete floor that was at ground level. (Tr. 29, 89)

7. Flooring had not been installed on the second-floor level; hence, a fall from a floor opening on the roof would result in either a twenty-two foot fall to the concrete ground floor or a fall of approximately half that distance upon the second-level bar joists. (Tr. 28, C-2)

8. On August 6, 1980, one of respondent's employees, Timothy Scigliano, fell through a floor opening on the south roof which was not guarded by standard guardrails nor covered. (Tr. 56-57, 59)

9. The fall occurred while Mr. Scigliano was counting insulation that was stacked on the south roof. While counting he stepped backward into said floor opening, which was 19 inches wide and 3 feet, 8 inches long. (Tr. 21, 70, C-3)

10. As a result of the fall Mr. Scigliano sustained severe injuries including a concussion, broken back, four broken ribs, and three broken vertebrae. (Tr. 64)

11. On the morning of August 6, 1980, there were a number of uncovered floor openings on the south roof. (Tr. 58, 60, 62, 98)

12. These uncovered floor openings were roughly the same size as the one into which Mr. Scigliano fell. (Tr. 85)

13. All such floor openings could have been covered to prevent someone from falling into them by placing plywood sheets over the

openings. (Tr. 35)

14. The general contractor provided a sufficient amount of plywood sheets to cover all the floor openings that existed on the south roof. (Tr. 98, 107)

15. Some, but not all of the floor openings on the south roof were "curbed", which curbing consisted of a parapet wall 18 inches or less in height which bordered the edges of such floor openings. (Tr. 104, 112)

16. The morning of August 6, 1980, respondent's foreman caused to be covered all the floor openings on the south roof except the floor openings that were "curbed". (Tr. 106)

17. The floor openings that were "curbed" were not covered on August 6, 1980. (Tr. 106, accord Tr. 66-67, 69)

18. After causing the floor openings that were not "curbed" to be covered, respondent's foreman inspected the south roof the morning of August 6, 1980, and determined that the floor openings were either covered or "curbed". (Tr. 101-02, 106)

19. The accident involving Mr. Scigliano's fall occurred shortly after lunch, between 12:10 p.m. and 1:00 p.m., on August 6, 1980. (Tr. 75, 102; accord Tr. 75)

20. The floor opening into which Mr. Scigliano fell was not covered nor "curbed". (Tr. 59, 82)

21. Said floor opening was cut into the roof by another subcontractor while respondent's employees were off the roof for lunch. (Tr. 81-82)

22. Unless the "curbed" floor openings 18 inches or less in height are covered, an employee can trip over the curbing and fall into the

floor opening. (Tr. 112)

23. The presence of curbing no more than 18 inches in height around floor openings will provide some fall protection, but it will not prevent someone from falling into the floor openings. (Tr. 114)

24. On the morning of August 6, 1980, respondent's foreman instructed respondent's employees to be careful because of the existence of floor openings in the area in which they were working. (Tr. 62)

## Conclusions of Law

1. Respondent failed to comply with 29 C.F.R. §1926.500(b)(1) in that it caused its employees to be exposed to floor openings located on the roof of respondent's worksite which were not guarded by standard railings or covered, as specified in 29 C.F.R. §1926.500(f)(1) and (f)(5)(ii) respectively.

2. Respondent did not have actual or constructive knowledge of the existence of the floor opening through which one of its employees fell.

3. Respondent had actual knowledge of the existence of "curbed" floor openings that were not guarded by standard guardrails nor covered, which openings were accessible to respondent's employees.

4. Respondent's asserted defense that it neither created nor controlled the noncomplying conditions has not been established in that the proof does not establish that respondent could not control the conditions to the degree that it could not realistically correct such conditions, and for the further reason that the evidence does not show that respondent took steps to cause the responsible contractor to abate the hazards created by such noncomplying conditions.

5. Respondent's affirmative defense not having been established,

respondent violated 29 C.F.R. §1926.500(b)(1).

6. The aforesaid violation was serious in that if a fall were to occur at respondent's workplace as a result of its failure to comply with the cited standard, there is a substantial probability that death or serious physical injury could result.

7. Taking into consideration the statutory factors, the proposed penalty of $280.00 is appropriate.

Discussion

The single charge at issued here is an alleged violation of 29 C.F.R. §1926.500(b)(1) which provides:

> Floor openings shall be guarded by a standard railing and toeboards or cover, as specified in subparagraph (f) of this section. In general the railing shall be provided on all exposed sides, except at entrances to stairways.2/

The specific allegation, as set forth in Citation No. 1, Item No. 1, is:

> 29 C.F.R. 1926.500(b)(1): Floor opening(s) were not guarded by standard railings and toeboards or covers:
>
> (a) 2750 South Wadsworth, Denver, Colorado, 3rd level floor openings, 1 ft, 8 inches wide and 3 ft, 7 inches long was not guarded.

The specific floor opening referred to in the citation is the

---

2/ As prescribed by 29 C.F.R. §1926.500(f)(1), a standard railing shall consist of a top rail, intermediate rail, toeboard, and posts, and shall be a vertical height of approximately 42 inches from upper surface of top rail to the floor. The intermediate rail shall be halfway between the top rail and the floor. Floor opening covers are required to be capable of supporting the maximum intended load and so installed as to prevent accidental displacement. 29 C.F.R. §1926.500(f)(5)(ii).

floor opening into which one of respondent's employees fell on August 6, 1980, and sustained severe injuries. The proof establishes that there were several floor openings accessible to respondent's employees the morning of August 6, 1980, at this same worksite. These floor openings consisted of two groups. The first were floor openings which were flat with the surface of the roof. The second group were those which were "curbed". The curbing of this latter group of floor openings consisted of flashing which extended vertically above the edges of the floor openings no higher than 18 inches.

The morning of August 6, 1980, respondent's foreman caused the floor openings which were flush with the surface of the roof to be covered with 4' X 8' sheets of plywood; however, he did not cover the "curbed" floor openings. After taking these protective measures, two of respondent's employees proceeded to stack insulation in various parts of the roof as a prelude to commencing the roofing of the building. The testimony establishes that sometime after lunch, the two employees returned to the roof for the purpose of counting the insulation to determine whether sufficient quantities were there to insulate the roof. While counting the insulation one of the employees fell into the floor opening, particularly described in the citation, and sustained serious injuries.

The evidence establishes that this particular floor opening was not present when respondent's employees went to lunch. It was made by employees of another contractor while respondent's employees were at lunch.

Under these circumstances, it is clear that respondent did not

have actual knowledge of the existence of this particular floor opening. It further appears that, even with the exercise of reasonable diligence, respondent could not have been expected to have known of such opening. Thus, as to the specific violation alleged in the citation, it is found that respondent did not have actual or constructive knowledge of the violative condition. Since actual or constructive knowledge of non-complying conditions is a prerequisite to the establishment of a violation,3/ the specific violation alleged in the citation has not been established.

Nevertheless, the evidence establishes the existence of other violations represented by respondent's failure to protect its employees from the other floor openings which were "curbed". The threshold issue presented here is whether these unpleaded conditions can be a basis for a determination that respondent violated the standard. Fed. R. Civ. P. 15(b) provides in pertinent part:

> When issues not raised by the pleadings are tried by express or implied consent, they shall be treated in all respects as if they had been raised in the pleadings. . . .

In this case, the record clearly shows that these unpleaded issues were tried by the implied consent of the parties. The existence of the "curbed" floor openings and respondent's failure to cover them was established by respondent's direct examination of its foreman. (Tr. 98, 101) This issue was then the subject of extensive cross-examination

---

3/ Daniel International Corp., Wansley Project, 9 BNA OSHC 2027, 1981 CCH OSHD ¶25,813 (No. 76-0181, 1981)

which was not objected to by respondent.[4/] (Tr. 106, 110, 112-14) Thus, it is appropriate to treat the issue of the existence of "curbed" floor openings which are not guarded by standard railings or covered as if such issue had been raised by the pleadings.

The evidence establishes that there were an undetermined number of floor openings which were "curbed". They were not guarded by standard guardrails nor where they covered to prevent someone from falling through such floor openings.

It could be argued that the protection afforded by the curbing was equivalent to the provision of a guardrail that was approximately the height of the intermediate rail prescribed by 29 C.F.R. §1926.500(f)(1). Indeed, the curbing might best be described as constituting a toeboard which approached the prescribed height of imtermediate railings. It would effectively prevent the falling of materials through the opening. It would also reduce the likelihood of someone falling into the floor opening, but it would not prevent such occurrence. Indeed, the curbing posed a tripping hazard which could result in someone tripping on the curbing and falling through the floor opening. Since the cited standard applies to those conditions where there is a danger of employees falling through floor openings (29 C.F.R. §1926.550(a)), it is found that

---

4/ The single objection made concerning this issue was one of competence (Tr. 113).

respondent failed to comply with an applicable standard[5/] and that respondent, through its representatives, had actual knowledge of the violative condition. Thus, a prima facie violation of the standard has been established.

Respondent's Affirmative Defense

Respondent has raised the defense that it is not responsible for the violative conditions that existed at its worksite for the reason that it did not create nor control such conditions. The proof shows that respondent did not create the violative conditions. Further, it can be assumed that respondent could not realistically be expected to take all the steps necessary to come within literal compliance with the standard. Nevertheless, to establish the asserted defense it must be shown that the employees of a non-creating, non-controlling contractor of a multi-employer worksite were protected by means of realistic alternative measures or that such measures were unavailable. Data Electric Company, 5 BNA OSHC 1077, 1977-78 CCH OSHD ¶21,593 (No. 13122, 1977); Anning-Johnson Co., 4 BNA OSHC 1193, 1975-76 CCH OSHD ¶20,690 (No. 4409, 1976).

Here, respondent provided realistic measures to protect his employees against the floor openings that were flat. It placed plywood over

---

5/ Section 1926.500(b) is captioned "Guarding of floor openings and floor holes". It sets forth requirements for such guarding. The definitions that apply to §1926.500(b) are contained in §1926.502. Pursuant to those definitions, the terms "floor hole" and "floor opening" as used in §1926.500(b) refer to specific openings in "any floor, roof, or platform." (emphasis added) Sections 1926.502(a) & (b). For this reason, §1926.500(b) requires the guarding of roof openings in the context of Part 1926.

such openings which constituted a cover. Such placement, by itself, would not prevent the accidental displacement of the covers as required 29 C.F.R. §1926.500(f)(5)(ii); nevertheless, it would prevent a fall through the floor openings absent the accidental displacement of the covers.

No additional protection was provided to protect respondent's workers from the hazard presented by the floor openings that were "curbed". The curbs here were less than 18 inches high, which was roughly equivalent to the protection provided by a guardrail that was even lower than the prescribed height of the intermediate rail. These curbs did provide some protection in that there is somewhat less of a likelihood of someone falling into the floor opening that is so curbed than there is one that is not curbed. Nevertheless, the curbing creates a tripping hazard and does not prevent someone from falling into the floor opening.

Thus, the question presented here is whether respondent realistically could have been expected to do more to protect its employees from the violative condition than it did. The evidence establishes that the answer is--yes! It easily could have covered the curbed floor openings the same as it did those that were not curbed. There were ample materials to do so, and the amount of additional time involved would have been insignificant. This additional action would have provided a significant degree of protection to respondent's employees beyond that which was provided. Having failed to do so, it is found that respondent, a non-creating, non-controlling contractor, did not do what was "realistic" under the circumstances to protect its employees

from the hazard to which the standard is addressed, even though literal compliance with the standard may have been unrealistic.

Even if the proof established that there were no means available by which the employer could have physically protected its employees against the hazard created by the violative condition, which is not the case here, the employer must, nevertheless, take the step of requesting the responsible contractor to abate the hazard. Automatic Sprinkler Corporation of America, 8 BNA OSHC 1384, 1980 CCH OSHD ¶24,495 (No. 76-5089, 1980). Here, the evidence establishes that respondent did not take such step.

The only request made by respondent's representative was the request to the general contractor for plywood. The contractor, in compliance with this request, supplied sufficient plywood to cover the floor openings in the area of the roof in which respondent's employees had access. This request by respondent's representative connotes an assumption of responsibility by him to abate the hazard rather than a request that the responsible contractor abate it. Thus, respondent's defense is rejected, and respondent is found to have violated the cited standard.

In this case there is no question but that the violation was serious in nature. If someone were to fall through one of the curbed floor openings, the same type of serious injuries that were sustained by respondent's employee on August 6, 1980, could be expected to occur.

Complainant proposes a penalty of $280.00 for this violation. Here, it appears that respondent acted on the misapprehension that it was not required to guard the "curbed" floor openings. Thus, it is

found that respondent acted in good faith. It further appears that respondent is a medium-sized employer, with no previous history of violations. Taking these factors into consideration together with the gravity of the violation, it is found that the proposed penalty of $280.00 is appropriate.

ORDER

In view of the foregoing, it is hereby ORDERED that Citation No. 1, Item No. 1, is AFFIRMED, and a penalty of $280.00 is ASSESSED.

Date: July 12, 1982

APPEARANCES:

Debra H. Green, Esquire, Office of the Solicitor, U. S. Department of Labor, Birmingham, Alabama, on behalf of complainant

E. Grady Jolly and James R. Lockard, Esquires, Jackson, Mississippi, on behalf of respondent

## DECISION AND ORDER

BRADY, Judge: This proceeding is brought pursuant to section 10 of the Occupational Safety and Health Act of 1970 ("Act") to contest a citation and proposed penalty issued by the Secretary of Labor ("Secretary") pursuant to section 9(a) of the Act. The central issue in this case is the extent of an employer's responsibility for the conduct of an employee.

The basic facts are not in dispute. Luther McGill, Inc., is engaged in oil field construction and transportation of oil field equipment. On October 13, 1981, oil rigs were hauled by truck for the Well-Tech Company from an oil field in Shannon, Mississippi, to Well-Tech's equipment yard in Laurel, Mississippi. While unloading pipe racks which had been used in the oil field, the gin pole derrick came in contact

with an energized electric power line. One employee was killed and another severely injured.

All items of the citation were subsequently withdrawn except amended item 3 alleging violation of 29 C.F.R. § 1910.181(j)(5)(i)(a). The standard, which pertains to operation of derricks near electric power lines states in pertinent part as follows:

> (i) Except where the electrical distribution and transmission lines have been deenergized and visibly grounded at point of work or where insulating barriers not a part of or an attachment to the derrick have been erected to prevent physical contact with the lines, derricks shall be operated proximate to, under, over, by, or near powerlines only in accordance with the following:
>
> > (a) For lines rated 50 kv. or below minimum clearance between the lines and any part of the derrick or load shall be 10 feet.

The violation is alleged in the amended citation as follows:

> 29 CFR § 1910.181(j)(5)(1)(a) [sic]: A derrick was operated where part of the derrick was within 10 feet of electrical distribution or transmission lines rated 50Kv or below that had not been deenergized and visibly grounded; nor had insulating barriers not a part of, or an attachment to, the derrick been erected to prevent physical contact with the lines:
>
> > (a) On or about October 13, 1981, at the Well Tech Equipment Yard, located at 2848 Industrial Boulevard, Laurel, Mississippi, employees of Respondent, who were helping position a load of oilfield piperacks, being unloaded through the use of an International 20 Ton Tandem derrick truck, under 12, 470 volt a.c. energized power distribution line(s), were exposed to electric shock when the mast of said derrick entered the 10 foot minimum clearance zone.

The evidence shows that on the morning of October 13, 1981, two of respondent's employees were assigned to the equipment yard to unload the pipe racks, and Glynn Douglas was the operator of the tandem truck which was equipped with a gin pole derrick. He had operated the truck used on the morning of the occurrence for approximately two of the three years he had been employed by respondent in that capacity. Testimony shows that he was aware that a distance of

ten feet was to be maintained between energized electrical lines and the gin pole derrick.

After the hoist cable was attached to the pipe racks (illustrated in Exhibit C-2), Douglas drove to the northeast corner of the yard to place them. He was directed, however, by a Well-Tech supervisor to unload the racks in the southeast corner of the yard. Driving to the southeast corner, Douglas began to lower the derrick to allow the racks to be turned lengthwise, as directed, when the derrick made contact with the electric line.

The evidence establishes, and respondent concedes, that there was a failure to comply with the cited standard. It is argued, however, that section 17(k) of the Act relieves an employer from liability for a serious violation if it "did not and could not, with the exercise of reasonable diligence, know of the presence of the violation." Thus, respondent maintains it could not foresee that Douglas, an experienced gin pole operator who was aware of the presence of the electrical lines, would operate the derrick within ten feet thereof.

In addition, respondent states that it could not foresee the factors which caused Douglas to violate the standard; i.e., (1) his partial blindness due to the sun which caused him to misjudge the distance between the derrick and the lines and (2) his following the instructions of the Well-Tech supervisor which caused the poles to be operated within the minimum clearance area.

Under the Act, an employer's knowledge is an element of proof of both serious violations under section 17(k) and nonserious violations, and the burden is on the Secretary to prove existence of that element. Brennan v. Occupational Safety and Health Review Commission, 511 F.2d 1139 (9th Cir. 1975). Clearly, where noncompliance results because of factors beyond the control of the employer, he

should not be found to have committed a violation. However, this line of reasoning is limited in scope to unpreventable occurrences which could not be predicted. Secretary v. Engineers, Inc., 75 OSAHRC 84/E11, 3 BNA OSHC 1537, 1975 CCH OSHD ¶ 20,012 (No. 3551, 1975). It is on this latter basis that respondent's argument must fail.

The record discloses that in May of 1980 an almost identical accident occurred in the same area of the equipment yard with the same truck. Testimony shows at that time an employee was present who directed the driver in operating the derrick, but he misjudged the distance (Tr. 10, 26). Also, testimony revealed that 90 percent of respondent's work areas are in the vicinity of energized lines; thus, accidents of this kind are clearly predictable. Therefore, as a minimum precaution based on this prior experience, an employee should be specifically designated to direct the operators of gin pole derricks at all times. Both of the factors respondent sets forth as causing the violation: (1) the sun causing Douglas to misjudge distance and (2) his following unsafe instructions of the Well-Tech employee, could have been eliminated by a supervised or properly directed work policy governing operation of the gin pole derricks.

While the evidence shows that the gin pole truck operator was experienced and aware of the distance to be maintained from the power lines, respondent was fully aware of the specific conditions for compliance with the standard but had formulated no policy for safe operation of the derricks to ensure such compliance. Respondent chose to leave the safe operation of the gin pole derricks to the personal judgment of the operators without establishing specific rules for their operation even in potentially hazardous areas.

The decision in H. B. Zachry Company v. O.S.H.R.C., 638 F.2d 812, 818, 819 (5th Cir. 1981) regarding the defense of employee misconduct or negligence defense is determinative in this case. The Court stated:

> . . . An employer must demonstrate that (i) all feasible steps were taken to avoid the occurrence of the hazard, General Dynamic v. O.S.H.R.C., 599 F.2d 453, 451 (5th Cir. 1977); Horne Plumbing and Heating Co. v. O.S.H.R.C., 528 F.2d at 571. This includes the training of employees as to the dangers and the supervision of the work site, Horne, 528 F.2d 56 at 569. And (ii) the actions of the employee were a departure from a uniformly and effectively communicated and enforced work rule of which departure the employer had neither actual nor constructive knowledge. See, e.g., General Dynamics, 559 F.2d at 465; Ames Crane and Rental Service, Inc. v. Dunlock, 536 F.2d 123 (8th Cir. 1976) . . . When faced with this defense, reviewing courts have consistently looked at the record evidence of the employer's safety program . . . Although there is substantial evidence that Zachry had a safety program and work rules requiring cranes to maintain a minimum of ten feet clearance from energized power lines, the ALJ and Commission found deficiencies in the communication and enforcement of the rule . . . Thus the company's attempted defense of employee negligent misconduct fails because of the employer's inability to establish to the satisfaction of the factfinder that it effectively communicated and enforced work rules which were necessary to ensure compliance with OSHA standards.

Therefore, respondent's serious violation of the standard was reasonably preventable and could have been predicted with the exercise of reasonable diligence.

The next question for determination concerns the amount of penalty to be assessed for the violation. Under section 17(j) of the Act, the Commission is required to find and give "due consideration" to the size of the employer's business, the gravity of the violation, the good faith of the employer, and the history of previous violations in determining the assessment of an appropriate penalty. The gravity of the offense is the principal factor to be considered. Nacirema Operating Company, Inc., 72 OSAHRC 9/A2, 1 BNA OSHC 1049, 1971-73 CCH OSHD ¶ 15,032 (No. 4, 1972). The Commission stated in Secretary v. National Realty and Construction Co., Inc., 72 OSAHRC 9/A2, 1 BNA OSHC 1049, 1971-73 CCH OSHD ¶ 15,188 (No. 85, 1971), that the elements to be considered in determining the gravity are: (1) the number of employees exposed to the risk of injury; (2) the

duration of exposure; (3) the precautions taken against injury, if any; and (4) the degree of probability of occurrence of injury.

Weighing all the foregoing factors in light of the circumstances, including respondent's attempts at compliance, it is concluded that the proposed penalty in the amount of $480 is deemed appropriate.

## FINDINGS OF FACT

1. Luther McGill, Inc., at all times hereinafter mentioned, maintained a place of business at the equipment yard, Exit 29W, Interstate 59 North, Laurel, Mississippi.

2. On October 15 to 23, 1981, authorized representatives of the Secretary conducted an inspection of the aforementioned work site. As a result, respondent was issued a citation with notice of a proposed penalty.

3. On October 13, 1981, respondent operated a derrick near electrical distribution lines which had not been deenergized or grounded nor were insulating barriers erected to prevent plysical contact with the lines.

4. The derrick was operated within ten feet of a 12,470-volt energized line exposing employees to electric shock when it came in physical contact with the line.

5. The operator of the derrick was aware that the minimum clearance between the line and the derrick should be ten feet, but he misjudged the distance due to partial blindness caused by the sun.

6. Ninety percent of the areas within which respondent works are in the vicinity of energized electrical power lines and on May 26, 1980, a similar accident occurred in the same area of the equipment yard.

7. Respondent had no safety policy which was uniformly and effectively communicated and enforced.

8. The accident in this case was a preventable occurrence and foreseeable by respondent in light of the circumstances and its prior experience.

## CONCLUSIONS OF LAW

1. Luther McGill, Inc., at all times pertinent hereto, was an employer engaged in a business affecting commerce within the meaning of section 3(5) of the Occupational Safety and Health Act of 1970, and the Commission has jurisdiction of the parties and subject matter herein pursuant to section 10(c) of the Act.

2. Respondent is, and at all times pertinent hereto, required to comply with the safety and health regulations promulgated by the Secretary pursuant to section 6(a) of the Act.

Upon the basis of the foregoing findings of fact and conclusions of law, and the entire record, it is ORDERED:

1. The amended citation is affirmed and a penalty in the amount of $480 is hereby assessed.

Dated this 12th day of July, 1982.

STATEMENT OF PROCEEDINGS:

By letter dated February 14, 1979, The Carborundum Company, Electro Mineral

Division (respondent) contested[1/] a citation issued[1/] January 22, 1979, by the Occupational Safety and Health Administration of the U. S. Department of Labor (complainant or OSHA) after an inspection over the period November 13 to 17, 1978, at its facility located in Niagara Falls, New York, where it produces silicon carbide (SiC) in an open furnace process. The basis of the citation is an alleged exposure of employees to carbon monoxide (CO) produced during the burning process at the open furnaces. The three items of the citation that respondent is said to have willfully violated are:

1) The general duty clause[2/] in that it failed to provide effective monitoring by use of continuous CO monitors which would sound an alarm and activate a ventilation system when dangerous concentrations are reached. A civil penalty of $6,480 is proposed.

2) The general duty clause is that it failed to instruct employees on the symptoms and hazards of CO overexposure. A civil penalty of $5,040 is proposed.

Or, in the alternative (Tr. 7):

3a) 29 CFR §1910.1000(a)(2)[3/] in that two employees were exposed to

---

1/ Under the provisions of the Occupational Safety and Health Act of 1971, 29 U.S.C. §§651, et seq., citations are issued after inspection [§658(a)] and may be contested within a 15 working day period [§659(a)]. A hearing is then afforded to resolve the issues [§659(c)].

2/ 29 U.S.C. §654:

(a) Each employer-
(1) shall furnish to each of his employees employment and a place of employment which are free from recognized hazards that are causing or are likely to cause death or serious physical harm to his employees.

3/ This standard, 29 CFR §1910.1000 Air Contaminants, reads:

(2) Other materials-8-hour time weighted averages. An employee's exposure to any materials in table Z-1, the name of which is not preceded by "C", in any 8-hour shift of a 40-hour work week, shall not exceed the 8-hour time weighted average given for that material in the table.

excessive amounts of CO forbidden by that standard. The permissible exposure is 50 parts of carbon monoxide per million parts of contaminated air by volume at 25 degrees centigrade at 760 millimeters Hg (mercury) pressure (p/m); or 55 milligrams of carbon monoxide per cubic meter of air ($mg/m^3$), according to table Z-1 (see footnote 3);

b) 29 CFR §1910.1000(e)[4/] because feasible administrative or engineering controls were not determined and implemented to bring the levels within the permissible limit required by this standard; and

c) 29 CFR §1910.134(a)(2)[5/] since two employees were not provided with respirators who were exposed to CO as those are required by the standard. For these items [3(a), (b) and (c)], a civil penalty of $7,200 is proposed.

The hearing consumed 12 days within the period of March 25 to June 27, 1980. The affected employees were represented throughout by the Oil, Chemical and Atomic Workers International Union. Respondent admitted the jurisdictional facts alleged in the complaint that it is an employer having employees and affects interstate

---

4/ This requires:

(e) To achieve compliance with paragraph (a) through (d) of this section, administrative or engineering controls must first be determined and implemented whenever feasible. When such controls are not feasible to achieve full compliance, protective equipment or any other protective measures shall be used to keep the exposure of employees to air contaminants within the limits prescribed in this section. Any equipment and/or technical measures used for this purpose must be approved for each particular use by a competent industrial hygienist or other technically qualified person. Whenever respirators are used, their use shall comply with §1910.134.

5/ This mandates:

§1910.134 Respiratory protection.
Respirators shall be provided by the employer when such equipment is necessary to protect the health of the employee. The employer shall provide the respirators which are applicable and suitable for the purpose intended.

commerce. I conclude that the Commission has the power to decide this controversy. 29 U.S.C. §652(5) and 653(a). Respondent also agrees that the inspection by the OSHA personnel was proper and consistent with the Act and the complainant's regulations. It also admitted that CO exists in Building 82, the inspection site. (Tr. 3)

Post-hearing proposals and briefs were filed by complainant and respondent by October 8, 1980.

THE ISSUES:

Three main issues are presented essentially to decide the question of willfulness:

1. Whether the level of carbon monoxide exceeds the permissible level in Building 82;

2. Whether respondent's method of ventilating that building represents the current state of the art; and

3. Whether respondent's organization and system permits the working of an effective safety program to avoid endangering employees within Building 82 by exposure to carbon monoxide.

THE PRODUCTION PROCESS: 6/

The process of producing silicon carbide was devised by Edward G. Acheson almost 100 years ago, and the furnaces producing this compound bear his name. A furnace is about 48 feet long and four feet wide with sidewalls six feet high. An electrode is placed at either end. The furnace is filled to a six-foot height with sawdust, sand and coke and running longitudinally through this is a graphite core. Electrical current will pass through this powder and it is the major source of heat. Preparing the furnace to this point requires about 14 hours.

---

6/ There is little dispute concerning this operation and this section is taken mainly from respondent's post-hearing memorandum, appendix A thereto.

The current is then turned on and will run for 30 to 35 hours at 1700 to 1760 degrees centigrade. A cylinder of the silicon carbide will form around the graphite core. At the end of this time, the current is shut off and the furnace cools for 12 to 24 hours. The side walls are then removed and the unfused mix falls away allowing the core to cool. This takes 24 to 36 hours. It requires four to six hours to clean all the mix from the cylinder which, in as long a time, is then lifted off by an overhead crane after being broken away from the graphite core. The furnace is next prepared for another load.

This type of furnace is the only one used to produce the product (Tr. 552). Dr. Acheson founded the respondent company which is now the country's largest producer (Tr. 554).

Building 82 is 416 feet long and 92 feet wide with 12 furnaces in three groups, and 34 employees operating them over three shifts. The sides of the building, lined with louvres to allow air in, rise straight up then slant toward each other with a roof monitor (opening) along the apex to the outside. Cool, fresh air drawn in through the louvres is heated over the furnaces and rises out of the building through the monitor. No fans are used to remove the gases coming off the furnaces. These rise with the warmed air and are exhausted through the monitor.

A small room, called the lunch-room, is directly off the furnace area next to the lavatory and is where the employees may take their breaks.

THE ACCIDENT GIVING RISE TO THE OSHA INSPECTION:

Mark Farina worked in Building 82 for six weeks (Tr. 1440) when he reported at 11:30 p.m., November 12, 1978, for the midnight to 7:00 a.m. shift (Tr. 1400). The only other employee with him was Jim Martinkowski who had been working for only three days. No foreman had been assigned that night (Tr. 1401-1402). They

had done various tasks in the furnace room disconnecting number 35, hooking up number 36 from which fumes arose, which Mr. Farina did and Mr. Martinkowski raked down number 37 (Tr. 1400, 1404, 1407).

At about 2:00 or 3:00 a.m., Mr. Farina went into the lunchroom feeling sleepy and closed the door. Mr. Martinkowski was at the other end of the furnace room with the payloader (Tr. 1415, 1417). In a statement Mr. Farina gave prior to the hearing (Exhibit R-7) he told Jim that he had no more work and was going to rest and that if he fell asleep, Jim was not to allow him to sleep too long (Tr. 1450-1452). At about 5:00 a.m. he went for a drink and the next thing he remembers is waking up at the hospital. He doesn't recall seeing Mr. Martinkowski thereafter (Tr. 1417-1418).

Both men were found in the lunchroom at 7:00 a.m. by Homer Green reporting to work for the first shift (Tr. 28). The smell of gas was very strong in the lunchroom (Tr. 29, 31). He called the guards who summoned the ambulance. Mr. Martinkowski was pronounced dead on arrival at the hospital as a result of carbon monoxide intoxication with a blood carbon monoxide saturation of 46.2 percent. Mr. Farina was treated for carbon monoxide poisoning with oxygen and a pressure chamber. At 9:30 a.m. his carboxy hemoglobin (amount of carbon monoxide in his blood) was 55.3 percent (Dr. Gillick, Tr. 122).

THE EVIDENCE:

According to Mr. Farina, his training for work in Building 82 consisted of a five-minute meeting with a foreman (Mr. Kavanaugh) who instructed on the use of safety glasses, shoes and respirators. He learned the actual work on the furances with the crew (Tr. 1389-1390). He was not instructed on the gasses or fumes that occur in the building (Tr. 1391). Other crewmen told him that if he did feel sick or dizzy or had a sweet taste in his mouth to go and stand at the

open doorway and let the air hit him (Tr. 1392). The building is "smoky", "dirty" and "stinky" (Tr. 1394). At safety meetings, he did not recall any mention of fumes or gasses, emergency procedures, nor of any oxygen or air supply available in the area (Tr. 1399-1400). He received no instruction on any precaution to be taken in the lunchroom, specifically whether the door should be open or not and he doesn't remember whether the heater was on (Tr. 1413, 1418). He felt no headache, dizziness or upset stomach during the night of November 12 (Tr. 1424-1425). That night, the weather was damp, cool and felt heavy as were the fumes (Tr. 1459-1460).

Joseph Smith, an OSHA compliance officer, was sent to investigate the fatality on November 13, 1978, and during the course of the inspection was at the facility six or seven times (Tr. 1185-1186). During the opening conference, he was told that in February 1978, four or five employees were overcome by carbon monoxide in the lunchroom and, as a result, the wall heater was installed there. That day, the fan was on "low" to create, he was told a positive pressure. But his meter showed that the air flowed inward -- not out -- at a rate of 150 feet per minute. The officer asked for results of samplings taken after that but none could be found. (Tr. 1187-1192). He did notice one carbon monoxide monitor equipped with an alarm there at the time (Tr. 1190). This was on an "I" beam 12 feet up outside of the lunchroom. The alarm was not working neither was the meter to produce a strip chart. He could not read the meter: it was too dark and too high up. (Tr. 1193-1195).

On November 15, 1978, he and industrial hygienist Michael Stratton took spot samples and on November 21, 1978, they returned to take a full shift sample (Tr. 1203). During the morning, very little carbon monoxide was found (Tr. 1204). But around noon there was a drastic change where two or three

furnaces were very active, numbers 41 and 42 (Tr. 1206). Some spot samples read 600 ppm, the limit of the meter (Tr. 1207-1207, 1128-1129 and 1135).

The full shift sample was taken with an ecolyzer which pumps in the air continuously and also has a direct read meter, Mr. Stratton explained (Tr. 1126). The lunchroom showed less than five (5) ppm on November 15, 1978 (Tr. 1127-1128).

November 21, 1978, was a "light day", less than a normal operation, some employees told Mr. Stratton. One furnace had been torn down and another built (Tr. 1135). But according to respondent's representative, the day's operation was normal (Tr. 1133-1134).

While some spot readings showed extremely high concentrations around the furnaces, on an eight-hour time weighted average, the reading did not exceed 50 ppm of carbon monoxide but was between 26 to 28 ppm (Tr. 1136). The test was taken on an employee who represented all (Tr. 1175, 1177).

Despite this, the decision was made not to go back for further testing because (1) the death of Mr. Martinkowski by carbon monoxide intoxication was enough to show a violation and (2) the backlog of other work (Tr. 1137).

Mr. Stratton admitted that any reliance by OSHA on studies made by the Enviornmental Protection Agency which were made available by respondent to OSHA would be in error (Tr. 1138-1139) because these have no application to employee exposure (Tr. 1173-1174). Further, the spot samplings which he and Mr. Smith took were not geared to an employee's position at work (Tr. 1175). He also stated that no OSHA standard requires an employee to monitor for carbon monoxide, nor for an employee's carboxy hemoglobin readings (the presence of carbon monoxide in the blood), nor to extrapolate its presence from mathematical formulae (Tr. 1178-1182).

Mr. Smith testified that OSHA characterized the alleged violations as willful

because of (1) the previous incident in the lunchroom in February 1978, with four or five employees overcome by carbon monoxide; (2) the failure to take samples to determine the levels; (3) two previous reports by Resources Research, Inc., indicating very high levels of the gas and which also mentions cross-drafts within Building 82 affecting the natural ventilation and outflow of carbon monoxide; (4) respondent knew of the presence of the gas because the overhead crane operators had been affected and respondent enclosed and ventilated the cabs; and (5) respondent's installation of the unconnected monitor which accomplished nothing (Tr. 1209).

Further, respondent's training program was ineffectual because it did not advise the employees of the presence of carbon monoxide, its symptoms and effect, nor what to do if exposed. The symptoms are headaches, nausea, dizziness and difficulty in breathing. (Tr. 1246-1247). They were not told to go to medical only to go outside (Tr. 1248, 1250). Mr. Smith was told that if an employee went too often to medical, it could look bad (Tr. 1253). Because of the recurrence of the symptoms among the employees, respondent should have monitored these occurences normally (Tr. 1272-1273 and 1298). Mr. Smith could not obtain any documents showing a written employee training program and doesn't know if one exists (Tr. 1280). He knew of no company producing (SiC) whose training program went further than respondent's or monitored more nor had he learned of any deaths from carbon monoxide in any furnace room (Tr. 1283). He characterized respondent's reaction to Mr. Martinkowski's death as one of shock (Tr. 1287).

Mr. Smith was not aware that the monitor he saw was there only to test its durability (Tr. 1301). And while respondent's experience with carbon monoxide gas exposure in February 1978 was a significant factor in characterizing the

alleged violations as willful, Mr. Smith did not consider that the gasses arose from an experimental furnace, two combined as one -- the Whatmore furnace -- and that the experiment was discontinued in May 1978 (Tr. 1294-1295, 1297-1298).

According to the pathologic examination and laboratory report, Mr. Martinkowski died of asphyxia due to carbon monoxide poisoning and his blood carbon monoxide showed a 46.2 percent saturation (Ex. C-2, Tr. 255).

Edward P. Radford, M.D., is an acknowledged expert on the effects of carbon monoxide by reasons of education, training and experience. He is engaged primarily in research. (Tr. 392-403). The gas is produced by the partial combustion of any material containing carbon and has no color nor odor. It is one of the most toxic gasses known. (Tr. 404). Depending on the exposure level, the following effects occur: with 10 to 20 percent in the blood throbbing headaches will occur (Tr. 407); 20 to 30 percent will affect the nervous system (Tr. 411); 30 to 40 percent results in ataxia, loss of muscular coordination (Tr. 415); and loss of consciousness, coma, may occur at the 50 percent level (Tr. 416). At the 60 or 61 percent level, the person is dead (Tr. 425). Essentially, the gas interferes with the transport of oxygen denying this to the body's vital organs (Tr. 409). Body size and health are important factors which may increase the effect (Tr. 410 and 412).

The blood can absorb large amounts of the gas quickly if exposed, or this amount can build up slowly over a long period if the exposure is less during that time (Tr. 421). Blood can be analyzed to determine the concentration (Tr. 419 and 426). An exposure of 35 to 40 ppm over a long period would show a carboxic hemoglobin level of five percent which would be the same at 50 ppm over a shorter period (Tr. 468). That level is the average for one who smokes (Tr. 470). One exposed to 50 ppm of carbon monoxide would never reach a carboxic hemoglobin state of 40 percent (Tr. 480-481A). Headaches and upset stomachs may be caused

by anything and only five or 10 percent of the employees may show symptoms of exposure to carbon monoxide at a level of 50 ppm on a time-weighted average, so much depends on the health and condition of the individual (Tr. 467-468).

The only sure way to determine the exposure is regular blood sampling (Tr. 454). Personal monitoring is not as good because of the variants such as air flow, how it is worn and where (Tr. 453). And the only treatment is pure oxygen not aspirins which act only on symptoms (Tr. 451). Long exposure to the gas induces changes in the blood vessels which can then result in permanent injury and personality changes (Tr. 429-430). But so much depends on a person's general level of health (Tr. 439).

The concentration of 42.6 percent found in Mr. Martinkowski's blood, given his physical condition and age, could mean an exposure of up to 1,000 ppm. If he were resting at the time of exposure, it would have been two or three times higher; all over an eight-hour time period. Mr. Farina's level (55.3 percent) means a somewhat similar but not a much greater exposure. (Tr. 437-438).

Hydrogen sulphide, also found in Building 82 (Dr. First, Tr. 885), has a very potent odor at very low concentrations, 0.25 ppm, and affects the nervous system. It causes headaches, nausea and dizziness (Tr. 465). Sulphur dioxide has a sharp irritating effect in the nose and mouth (Tr. 464).

The complainant called nine employee witnesses all of who worked in Building 82 (Tr. 14-119, 126-202). Additionally, the testimony of seven others was stipulated by the parties to be substantially the same as the first nine had they so been examined (Tr. 204). These employees represent all three shifts and those with long-time employment. All testified to have suffered from headaches, burning sensation in the nose and throat, nausea, gasping, weak knees, severe chest pains, watery eyes, and vision problems. The frequency of these problems

varied from two or three times a week to once every two weeks. Donald Attfield (Tr. 94-118) was overcome by gas in the lunchroom in February 1978 and hospitalized. He did not know of the particulars of the experimental furnace or any aborted run occurring at that time.

Four of the witnesses who did testify operate the overhead cranes and will be, at times, directly in the path of the rising gasses. They evidenced the same symptoms as the other employees. One, Gordon Fogg, in October 1979, experienced such a violent headache which would not abate and he went to the medical department where he received aspirins. There is no record there of his appearance at the time. The nurse did not ask and Mr. Fogg offered no opinion as to the cause of his pain (Tr. 200). He did tell a representative of management, Glen Ziobrowski, that he was going to the medical department and was told by him not to tell the nurse that "he got gassed" (Tr. 198).

Somewhere at the end of 1979 or within the last two years (dating from March 1980) the cabs of the overhead cranes were enclosed and provided with a positive pressure ventilation system (Tr. 160, 167). While respondent has directed that the window be kept closed, operators open them to communicate with employees on the floor and a rope from the hydraulic system is passed through in one cab so that the window is open a crack at all times. (Tr. 201-202).

Generally, on damp or humid days or when the wind blows from the lake, the gasses tend to remain over the furnaces and rise very slowly. That weather keeps the gasses in the building. (Tr. 136-137, 161).

Prior to the accident on November 12, 1978, and unanimously, none of the employees had been instructed as to the nature or content of the gasses in Building 82. Their only instruction, from other experienced employees, was to go outside for air if they were affected. There were safety meetings held monthly

with foremen (Tr. 143) but these mostly related to production (Tr. 25, 104). Safety problems were not resolved (Tr. 147-149). After November 1978, the gas was discussed at meetings (Tr. 26), and, before, maybe once every three months would an employee raise the question (Tr. 71).

Respondent's safety manual booklet (Ex. R-1) which advises employees to go to medical whey they feel ill or are injured — but says nothing about gasses (Tr. 258-259, stipulation to this effect) -- was received by some employees, according to their testimony, when they first reported (Tr. 83), or after a span of time (Tr. 109), and Mr. Green who has been with respondent over 30 years received the manual but never read it (Tr. 49).

Paul T. Kavanaugh became a shift foreman in Building 82 in August 1976. His responsibility included the safety of personnel there (Tr. 258); but this is not assigned, he merely assumes it (Tr. 346). He received no training on carbon monoxide because, before November 12, 1978, there was no problem with it (Tr. 259-260, 274-275, 279). After that date, he was advised that the furnaces give off carbon monoxide (Tr. 287). From the first day there he smelled the fumes describing the odor as "a rotten egg" (Tr. 271). Each and every employee on his first day was told that if he felt dizzy or had a headache or felt weak-kneed, he was to get out of the building (Tr. 302, 310). The new employee is shown all around the building and, "We try to scare them so they watch out for themselves". (Tr. 310, 318, 329).

Prior to the fatality in November 1978, he had reported six or seven accidents involving fumes or gas (Tr. 280). On February 24, 1978, involving the aborted run on the experimental furnace, because of a broken water line (Tr. 305), there were seven men who went to medical (Tr. 281-284). The abortion caused more gas to be given off, i.e., the reaction was incompleted (Tr. 305).

The monitor that was located in Building 82, 12 feet up in the air, was only being tested for its durability and had no relationship to employee exposure (Tr. 292). An exhaust fan, also acting as a heater, was installed in the lunchroom after the February 1978 incident and there were no further problems there until November 12, 1978 (Tr. 307-308). Since that time, there seems to be more complaints regarding gas (Tr. 321).

Randall Coughenour was the Respondent's Safety Engineer from 1971 to June 1978 (Tr. 1638-1639). He holds no engineering degree but does have 15 years' experience (Tr. 1658). He would check Building 82 to determine the carbon monoxide levels at least once a year but he would liked to have done it every six months. That was not feasible. (Tr. 1640, 1654). Exhibit C-2 is the record of the sample taken for June 3, 1971. He took three samples around each furnace and in the crane cab (Tr. 1641) and his ultimate result would be the average of all samples taken at any position (Tr. 1644). That day this was 43.6 ppm on the floor and 87 ppm in the cab (Tr. 1644). He never took an eight-hour time weighted average as there was no reason and he didn't have the equipment (Tr. 1645-1646). At monthly meetings which he attended, there were no complaints about the fumes in the building (Tr. 1648); although "people" would refer him to the fumes there and he would go to sample the air and nine times out of 10 find no carbon monoxide problem (Tr. 1648). He never had any reason to inform management about a carbon monoxide problem (Tr. 1650-1651). On the floor area of Building 82, he never got a reading of over 50 ppm (Tr. 1655). And he tested in all kinds of weather and in all seasons (Tr. 1651, 1659).

Robert LaDue, in August 1978, became respondent's plant personnel and safety manager and was so until January 1980. He followed Mr. Coughenour. He holds a degree in psychology (Tr. 1017-1018). He was to implement company safety

programs and policies handling on a day-to-day basis safety and labor relations questions (Tr. 1019). He could not remember specifically what his instructions were when he was hired (Tr. 1020-1021). He met with Mr. Seymour, the corporate safety director, several hours a week discussing safety and specific problems but had taken no safety courses prior to this job (Tr. 1022). He had no background in safety and health (Tr. 1024).

Mr. Coughenour introduced him to Building 82 and its process but did not discuss gasses (Tr. 1024-1025). But he was aware of the presence of carbon monoxide although not of its dangerous potential (Tr. 1025-1026). He was not taught how to handle an employee exposed to carbon monoxide or to monitor but was since November 1978 (Tr. 1026-1027). As far as he knew, there was no industrial hygienist at this facility before November 1978 (Tr. 1028). He didn't know there was a heater in the lunchroom prior to the November 1978 accident (Tr. 1029). After that event he learned that Mr. Coughenour had sampled the building for carbon monoxide (Tr. 1039).

Respondent's investigation did not reveal what caused the accumulation of carbon monoxide in the lunchroom which killed Mr. Martinkowski (Tr. 1045). It was not his responsibility to determine whether the building's natural ventilation was functioning properly. He doesn't know whose it was. Before the November 1978 accident, he was not aware of the effects if the ventilation was not working properly. Now he is and he was involved in the purchase and installation of monitors and alarms throughout, gas masks and the instructions to employees concerning the gasses (Tr. 1049-1050, 1053).

Mr. LaDue reviewed the minutes of monthly safety meetings from 1974 to 1978 (Ex. R-5) and carbon monoxide was not discussed (T.. 1065). Nor has any grievance been filed on that subject from 1960 to 1978 (Ex. R-4, Tr. 1064).

But he did not know who, in respondent's corporate structure, would be responsible for determining whether there was a safety or health hazard in Building 82 (Tr. 1119-1120). In November 1978, Clifford Seymour was respondent's corporate safety director (Tr. 1464) and he testified that Mr. LaDue was responsible for discovering safety and health hazards in Building 82 (Tr. 1494).

John C. Kinzly is respondent's medical director, a Fellow of the Industrial Medical Association, and has been with the company on a part time basis since 1963 (Tr. 350-352). The medical department is staffed by two more part time physicians, four registered nurses, an X-ray technician and a secretary and is open round the clock (Tr. 353) with only qualified first-aid persons available on weekends (Tr. 354). A record is kept every time an employee reports to medical (Tr. 360).

The Doctor is aware of the presence of carbon monoxide in Building 82 (Tr. 364). The prime requirement is to get an exposed employee to fresh air; oxygen is essential, but fresh air is the biggest item (Tr. 365). These are the instructions in Building 82, it makes good horse sense (Tr. 368).

Physical exams are given initially then every two years. Blood tests are taken but the doctor did not know if these reveal the carboxic hemoglobin level. It isn't a routine procedure. (Tr. 366-367, 384, 385).

The symptoms of exposure are: headache, dizziness, upset stomach, skin color, perspiring, any or all of these (Tr. 369). He would instruct employees of the presence of the gas in the building (Tr. 370-371). The Doctor's staff is instructed to question employees on why, how or where the symptoms occurred (Tr. 373).

Prior to November 12, 1978, it was rare for an employee to complain about fumes; of 57 employees from Building 82 there were 11 such complaints (Tr. 381-382). After that, the frequency of complaints about headaches has increased

(Tr. 389-390, Exhs. C-5 and C-6). The Doctor was aware of the employee exposure to carbon monoxide in Building 82 but not the intensity (Tr. 387-388).

Included within respondent's medical records is the report of the death of Guiseppe Filocamo on December 7, 1956, in Furnace Room 21, the predecessor to Building 82 (Tr. 378-379, Exhs. C-7 and C-45). The cause of death officially is recorded to be arteriosclerotic coronary occlusion but the autopsy report and results of blood sampling showed a carboxic hemoglobin level of 35 percent. Dr. Eddy, respondent's medical director at the time had requested the blood sampling to be done. (Exh. C-45, p. 4). William Wagner, at that time, was respondent's Assistant Corporate Insurance Manager (presently he is a compliance officer with OSHA). He was at the scene of Mr. Filocamo's collapse at a furnace with Dr. Eddy and Mr. Wagner asked him why the victim, lying outside the furnace room, "had this cherry-red color". He had never seen this before. Dr. Eddy replied that it was due to carbon monoxide poisoning. (Tr. 1617, 1619).

Don C. Olson is a Project Manager for respondent (Tr. 770). In November 1977, he visited a Bethlehem Steel plant with Mr. Coughenour, then respondent's division safety coordinator to look at equipment used for monitoring carbon monoxide (Tr. 775-775). At the time, respondent was considering expanding its furnace operation and Mr. Olson was interested in monitoring equipment if the use of such equipment ever became necessary. At the time there was no problem in Building 82; to the best of his knowledge, it was within the limits as no employee was having a problem. (Tr. 778-780). The roof monitor (opening) was expanded over the experimental furnace and there were no complaints about fumes (Tr. 793-794).

After the accident in November 1978, he was involved in the purchase and installation of six monitors, MSA model 704 (Tr. 810-811). At the time of the

hearing, 20 monitors were in place (Tr. 819).

Lewis E. Fancourt is the Senior Sales Representative for Mine Safety Appliances of Pittsburgh, Pennsylvania (Tr. 485). On December 1, 1977, he forwarded a proposal for two systems of monitoring carbon monoxide which he had discussed with Mr. Coughenour. One of these is the MSA 704 Monitoring System. Either would do the job (Tr. 489). These systems were to be used in Building 82 (Tr. 492). The order came in shortly after November 13, 1978 (Tr. 500). Before this, Mr. Coughenour told him that if an engineering study proved successful, there would be no need for the monitors (Tr. 511). Off and on since 1955, he discussed with Mr. Seymour monitoring equipment for carbon monoxide. Respondent appeared to be interested in solving this problem (Tr. 518). In respondent's area in New York, steel companies, coke furnaces and garages use monitors, otherwise their use would be rare (Tr. 521).

Melvin W. First has been a Professor of Environmental Health Engineering at Harvard University since 1961. He is a registered professional engineer (Mass.), is certified in the comprehensive practice of industrial hygiene by the American Board of Industrial Hygiene, and is a Diplomate of the Enironmental Engineering Intersociety Board. (Tr. 856-859). He considers himself to be an industrial hygienist with his main interest being in the engineering control of occupational exposures and hazards (Tr. 859).

Dr. First spent two or three hours in Building 82 as part of his preparation leading to his testimony (Tr. 856). This was his first exposure to the Acheson furnace (Tr. 956). He described the reaction in the furnace as quite straight forward. The oxygen in the silicon dioxide (sand) combines with the carbon (coke) to form carbon monoxide and some of the coke combines with the silica stripped of its oxygen to produce silicon carbide. Three parts of carbon to one part of silica

results in one part silicon carbide and two parts of carbon monoxide based on the carbon content. Because of some sulphur present, hydrogen sulphide will be formed and its presence is an indication that the gasses had not been further reacted and carbon monoxide would also be there. (Tr. 884-886).

Air around a furnace is warmed from two sources: (1) the electrical current that initiates and sustains the reaction and (2) the burning of the waste products of carbon monoxide and hydrogen sulphide. The buoyant air rises and cooler flows in to take its place. This is the building's natural ventilation. Mechanical blowers would do the same job exchanging air in the building many times a minute. (Tr 887).

The difficulty with relying on natural ventilation is the toxicity of the substances involved. Temperature, wind velocity and direction and weather can affect the building's natural ventilation. Doctor First would not rely on this system if highly toxic substances are present. Carbon monoxide has a density or specific gravity only three percent different than air and the two mix and become homogeneous (Tr. 888-891).

The construction of the building itself impedes its natural ventilation. The openings along the side, faced with louvres, started 10 feet above the floor and four feet high. Fresh air being drawn in, therefore, was well above the operating floor which, then, did not get any benefit. The aisles between the furnaces were not being ventilated. Further the louvres, baffles, were at a 45 degree angle leaning in so all incoming air was directed up. (Tr. 895-896).

On this point, respondent had stipulated that the openings all along the side walls should be lowered (Tr. 805).

The total effect of this was a mixing and swirling of clean and contaminated air and the gasses from the top of the furnaces was directed down into the aisles. A minimum amount of dilution occurred (Tr. 896).

Carbon monoxide's lower explosive limit (LEL) is 12.5 percent by volume at normal temperature and pressure (Tr. 891). Less than this, it will not burn. As the furnace begins to heat, a period of about an hour, this level is not reached and lethal concentrations will be released and must be vented out. This could amount to 1000's ppm and clearing them should not be left to natural ventilation alone (Tr. 907). Some sort of mechanical ventilation should be activated when this occurs (Tr. 908).

Carbon monoxide as it is constantly being evolved can be controlled but exposure to it is known as chronic carbon monoxide poisoning. Sudden exposure to high levels leads to acute poisoning (Tr. 906). Mechanical ventilation must be employed in controlling the latter event. Doctor First would install fans along the open roof blowing out, with ventory throats to capture the air around the fan and which would operate when a monitor finds too much of the gas. (Tr. 915-917, 935-937). He would use 12 fans at $4500 each plus three to four times the initial cost for installation. All could be done within a year. (Tr. 936-937). The fans would have to be capable of removing 100 cubic feet per minute for every square foot of floor space; but Dr. First did not calculate how much larger (Tr. 966-967). Fans would not create a down draft or bring air in from the roof (Tr. 969).

Dr. First examined the ventilation device in the lunchroom and, because of the size of the inlet pipe and its bends, found it to be inadequate to create a positive pressure in that area (Tr. 934).

Leo C. Greenburg, another of complainant's expert witnesses, trains safety specialists (Tr. 716-719) is presently employed as an Associate Professor of Safety Engineering at the Illinois Institute of Technology in Chicago, Illinois. He holds both bachelor's and master's degrees in mechanical engineering and a doctorate in

industrial safety. He is a licensed professional engineer in New York and a licensed professional safety engineer in California and a certified Technical Professional. In the field of safety he has taught, practiced and consulted. (Tr. 714-717). Respondent had no objection to Dr. Greenburg testifying in this case (Tr. 725-726).

In response to a question regarding the evaluation of hazards and safety programs in the furnace building, Dr. Greenburg responded:

> Here we have a combustion process...one should immediately become suspicious of...is that the combustion is incomplete and then you have some carbon monoxide. Some. One doesn't know initially how much. Hence the first objective is to determine, do we have carbon monoxide in the work place, to what extent and how is this reflected, is it all the time, certain times, how does this translate to worker exposure, to what extent are we exposing the employees to what levels...and perhaps a visual examination may be (SiC) occur, but beyond that, one has to start quantifying by use of measuring instruments, appropriate measuring instruments. (Tr. 729).

A review of a company's medical reports will reveal a source of danger or breakdown of a safety mechanism (Tr. 730). At respondent's plant, there was a lack of control of air flow and winds might bring down a rising plume of smoke into the work area (Tr. 731).

An employee must know the dangers inherent in his job (Tr. 734). Giving an employee a whiff of a furnace is dangerous because carbon monoxide has no odor and he will learn nothing from this. If he doesn't know, he can't tell management and he might attribute an illness to something other than the real cause. (Tr. 735-736).

No deaths within a plant doesn't reveal anything just that conditions "are not horrible" nor good. This assumes that the cause of any deaths was carefully inquired into. (Tr. 739-740, 742).

Dr. Greenburg was at Building 82 for about an hour and a half and this plus the background he received on the operations were sufficient for him to suggest

approaches for control. (Tr. 741-742). His testings showed a low of three ppm to a high of 160 ppm of carbon monoxide. The latter went down to 60 ppm very quickly and he got none over 50 ppm for over one minute. Strong winds went through the building when he was there. (Tr. 752-754). Air movers (fans) must be installed in the roof enough to draw about 100 cubic feet per minute for every square foot of floor area. The louvres along the sides will have to be lowered or these should be pierced (since they now face upward) to allow air through. To avoid gusts of wind through doors (six of them), curtains of heavy plastic should be hung to stop wind but allow vehicles through. Alternatively, high side walls should be placed into position around a furnace going into operation. This will protect workers in their vicinity and the furnaces from the effects of the winds. (Exh. C-27).

The parties stipulated that Dr. Greenburg's recommendation concerning air movers (fans) was the first mention by any OSHA representative about mechanical ventilation (Tr. 1266-1267, 1269-1270).

Hakon Skistad of Klaebu, Norway is employed by the River and Harbour Laboratory Division of the Norwegian Hydrodynamic Laboratories at Trondheim, Norway. Since May 1979 he has headed the section of Ventilation and Industrial Flow Problems. Before that, he was the senior research engineer in that section working on a number of projects involving the ventilation of industrial processes. One of these, begun in 1975, was to study and improve the ventilation of silicon carbide furnace rooms. Recommendations from this study are being implemented and evaluated at the Orkla Exolon plant in Orkanger, Norway. He also instituted a project to study the fundamentals of two-layer ventilation noticed during the water model investigation of the furnace rooms and this is funded by the Government's Research Council. This study is still in progress. (Tr. 1911-1913). Mr. Skistad is a mechanical engineer holding a degree roughly equivalent to a

Master's with an emphasis on aerodynamics (Tr. 1914-1915).

In 1975, The River and Harbour Laboratory, an independent organization, was approached by the Norwegian silicon carbide producers to study the ventilation in the furnace rooms because the permitted level of carbon monoxide was going to be reduced from 50 ppm to 35 ppm. Three producers were involved who agreed to pay one-half of the cost of the model study with the remainder paid by the Government. (Tr. 1917-1919). A water model was created because the flow dynamics of air and water are the same but changes are more easily measured using dyes in water (Tr. 1920).

The initial study revealed problems: the furnaces cannot be enclosed; they produce larger amounts of toxic gasses; hoods cannot be used because of explosion possibilities; the furnaces within the room are operated on cycles; curtains around them would be destroyed by furnace blow (eruption of gasses inside the furnace); and the carbon monoxide created must be converted into carbon dioxide so the velocities of air currents must be kept small (Tr. 1920-1921).

The two year study using the principles of natural ventilation, which have been known for a long time (Tr. 2055), resulted in a system producing clean cold air flowing below an upper layer of warmer heavily polluted air. The air flow rate had to be within a certain range incoming at a low velocity close to the floor and evenly distributed. (Tr. 1921-1922). The heat produced by the furnaces is the key and the energy producing factor which keeps the system going (Tr. 2145).

Implementation of the study's recommendations and their evaluation has been going on for three years and is not yet complete at the three plants in Norway (Tr. 1923). Since the study is still in the experimental stage, no industry practice has yet developed or has any system been accepted (Tr. 1930). Implementation is furthest along at the Orkla plant and the carbon monoxide levels

there are well within the 50 ppm limit (Tr. 1931). At the second plant, Exolon, Mr. Skistad estimates the level to be around 30 ppm or between 20 and 40 ppm on a time-weighted average (Tr. 2003).

The natural ventilation system creates two-layers and was demonstrated by Mr. Skistad in a movie using smoke bombs (Tr. 1971-1972). The fresh air is at the employee level and polluted air above the furnaces (Tr. 1932). The benefits from this system have not been known or studied before this endeavor (Tr. 2142).

The respondent retained the Laboratory in the spring of 1979 to evaluate Building 82. Mr. Skistad spent two weeks there reviewing, testing and observing the patterns with smoke bombs. His conclusion is that the building is practically identical to the model, but even there, the effectiveness of the system is not yet proven (Tr. 1925-1926) but he is sure he is on the right track (Tr. 2040). This was the respondent's first attempt since the building was erected in 1941 at determining feasible or engineering controls for reducing carbon monoxide levels (Resp.'s Answers to Interrogatories, nos. 4 and 6, marked as Exh. C-53).

Mr. Skistad's preliminary report was submitted on July 25, 1979. He recommends (Tr. 1928): (1) reducing the outlet of roof monitor to prevent instabilities created by air being pulled back down. This does not affect the ventilation rate and reduced drafts as proven at the Orkla plant (Tr. 1936); (2) lowering the louvres and redesigning them to reduce velocity of incoming air and providing for a more gentle flow (Exh. C-32, page 12). They would start three feet off the floor to prevent dust swirling and be five feet in height below the polluted air layer (Tr. 2081-2082). This also controls the wind (Tr. 1937, 2052); (3) installation of shields from point where roof meets the lower side of building (beginning of roof's inwardly slant) so polluted air would not swirl downward. This has been delayed because of problems of higher temperatures and reduced visibility for crane operators and is being studied (Tr. 1929); and (4) closing

all doors to prevent turbulence (Tr. 1946). His final report with all this was submitted in January 1980 (Tr. 1928, Exh. C-32).

Building 82 is well-suited for natural ventilation as the Arendal plant in Norway is and where the best results are being obtained. (Tr. 1933). But presently there is no two-layer system in the building because the openings are improper with a result of too much mixing of good and bad air (Tr. 1935, 2015). However, the natural ventilation there could explain why employee complaints are rare (Tr. 1934-1935).

Administrative controls are needed when a furnace is first lit. Carbon monoxide inside near the core diffuses to the outside cold air and disappears in a short time. These furnaces should be fired (outside area lit and burning) as soon as possible, within an hour, and employees instructed to keep away. He knows of no mechanical ventilation system to alleviate this condition. (Tr. 1933-1934). Ceiling fans will not control horizontal movements of air along floor level (Tr. 1938).

In Mr. Skistad's research and experimentation he has found no proven system of mechanical ventilation (Tr. 1951). One of six plants he has seen uses this method, Norton Lillesand in Norway, because its layout is wrong for natural ventilation (Tr. 2053). A new mechanical system is being designed to create the two-layer effect with $1 million having been spent so far. It is still being evaluated. (Tr. 1942-1943). Dr. Greenberg's suggestion of a rate of air exchange of 100 cubic feet per minute for every foot of floor space is seven or eight times Mr. Skistad's flow and would (1) blow out the furnaces and (2) create horizontal drafts and turbulence as the air entered (Tr. 1949-1950). Dr. First's fans along the roof monitor would create downdrafts between them from the vacuum they would create and aggravate the conditions (Tr. 1950). Mr. Skistad

has seen mechanical ventilation used to supplement natural ventilation but not successfully (Tr. 2092). Such a system would be a good idea to operate in emergencies (sudden, high levels of gas) but he hasn't seen one that could work (Tr. 2156-2157). If the heat source, the furnace, fails the system breaks down but fans won't help because the polluted air would be brought down through the roof monitor (Tr. 2145-2146, 2148-2149).

Winds have not affected the time-weighted averages at Orkla where very strong winds blow. The same result is expected at Building 82 (Tr. 1941-1942). Outdoor temperatures have no effect since the two-layer system works on the differential between the inside furnace heat and the outside and this difference is always present. Even when a furnace is cooling, pollutants are also reduced, another is heating (Tr. 1944). The air at working level is the same as outside but it seems hotter because of radiation from the furnaces (Tr. 1946). Theoretically, a thermal inversion (upper air cooler than lower) could affect natural ventilation. But his projected air flow of about 137,000 cubic feet a minute per a furnace group could be maintained with inversions of up to 30 degrees. But these are so rare he attaches to them no significance. (Tr. 1945).

Mr. Skistad knew of no deaths from carbon monoxide poisoning, at least no one in the course of his research reported any except Mr. Martinkowski (Tr. 1937-1938, 2004-2005).

When all of his recommendations are implemented, Mr. Skistad does not know what the level of carbon monoxide will be in Building 82 (Tr. 2014). And for the time before November 12, 1978, he would have to know the conditions of the louvres, doors, etc., how they were operated before he could estimate what difference there was between then and now. Assuming an opening and closing that

was evenly distributed (one-half open and rest closed), as he was told,[7/] he doubts that there would have been any significant differences. (Tr. 200-2001, 2019-2021).

Respondent called John A. Ciccarelli who is currently Operations Manager for respondent and from August 1978 to January 1980 was the Business Unit Manager for silicon carbide. He holds a degree in chemical engineering and has done some advanced study in metallury and statistics. In both of the positions, he is responsible for the scheduling and manufacture of the product, pollution control and safety. He reports to the General Manager of the Electro Minerals Division, the highest ranking person there. (Tr. 1792-1794). He is responsible for the work done in Building 82.

He knew that carbon monoxide was present in the building as a by-product of the process (Tr. 1797-1798). There had been the incident, in February 1978, of the aborted run on the experimental Whatmore furnace affecting several employees in the lunchroom. To correct this, outside air was brought in by means of a ventilation unit installed by an outside firm (Tr. 1799-1802). Prior to this time, he was not aware of any incident involving fumes (Tr. 1802).

Instructions to employees in November 1978 were to go outside if they felt dizzy, lightheaded or nauseous and if that didn't help, go to medical (Tr. 1804). He believes that the gases were identified to new employees (Tr. 1805). Prior to this time, the Safety Department took readings (Mr. Coughenour) periodically showing no problem (Tr. 1807-1808).

---

7/ This does not comport with Mr. Kanvanaugh's description of openings and closings.

After November 1978, monitoring was done on every shift throughout the building by the Safety Department, line management and foremen. Continuous monitoring equipment was purchased and installed, 19 units by the end of 1979 (Tr. 1837). Results show an exposure of well below 50 ppm on a time-weighted average although there are spikes of higher readings. (Tr. 1808-1809).

The highest release of carbon monoxide occurs when a furnace comes off line. The furnace next to this would be in the stage for the pins to be removed for unloading. An employee would be next to the first furnace. (Tr. 1811-1814). That operation requires 10 minutes. Another exposure to a burning furnace giving off the gas is to the operator of the front-end loader emptying or loading a cooled furnace next to a burning one. This could take two hours (Tr. 1814). It takes five or six hours to remove a cylinder and the furnace next to this operation could be burning. Two employees are engaged in this. (Tr. 1816).

Putting on side frames requires up to an hour and a half and loading a furnace 16 hours, all while other furnaces are burning (Tr. 1818-1819).

In March 1978, model studies had been completed in Arendal, Norway, to reduce the exposure because there the limit was being lowered from 50 ppm to 35 ppm. Respondent sent a four man team over. (Tr. 1822-1823). By November 1978, no results had been received for they were still implementing and as of the hearing date this was still incomplete (Tr. 1824). In the spring of 1979, the Norwegians were hired by respondent (The University of Trondheim, Norway) and its final report was submitted in January, 1980. All of the recommendations concerning ventilation are to be implemented. (Tr. 1825-1826). The cross section of the roof monitor was reduced to increase the velocity of the fumes out; isolation panels were installed along the entire sides to sweep the air up at the furnaces;

and more louvres were installed all the way down both sides of the building. This cost $600,000. (Tr. 1827). The foreman's office, the rest room and chipping room are to be removed outside of the building at a cost of $500,000 (Tr. 1828). The company is also experimenting with a vacuum crane to replace the loaders that empty the furnaces. This is estimated to cost an additional $1.1 million. (Tr. 1828-1829). Each employee has been given a card identifying the presence and dangers of carbon monoxide and signs to this effect have been posted (Tr. 1842).

Immediately following the death in November 1978, 50 percent of the louvres were opened by company rule, about six or seven (Tr. 1867, 1872) and two malfunctioning doors of a total of six were repaired which should have been closed (Tr. 1868, 1873).

Paul Kavanaugh, one of the foremen in Building 82, was recalled by the respondent and stated that before November 12, 1978, the louvres were closed from November to March and open the rest of the year (Tr. 1885). They were opened once a year and closed once a year and otherwise not touched (Tr. 1891). Also before that date, some doors were left open and others closed. After November 12, 1978, they were told to keep them all closed (Tr. 1894).

Based on the testimony of Messrs. Ciccarelli and Kavanaugh concerning changed conditions in Building 82 since November 12, 1978, respondent's proposed exhibit R-15, sponsored by a previous witness, Catherine Ver, was rejected. The effect of these changes appear to be capsulized in a memorandum dated May 7, 1979, from Robert Letsche, plant manager. (Tr. 621, Exh. R-9). Paragraph 7 of this memo states:

> The present CO monitors in the Building are functioning and do sound an alarm when the CO level is excessive. There are fewer events now that the Building is well ventilated.

Ms. Ver was a member of a team that performed extensive testing throughout the building (Tr. 1751-1791). The readings and results are contained in exhibit R-15. No reading on a time-weighted average exceeds 50 ppm (Tr. 1764). All of this information and data were gathered after November 12, 1978 (Tr. 1898). The exhibit and her testimony do not provide a basis for comparing conditions as they were and as they are now and here exhibit, R-15, was rejected (Tr. 1896-1899, 2549). It was offered for this purpose[8/] (Tr. 1897).

Geraldine B. Baylor is a Registered Nurse, a Certified Occupational Health Nurse (Tr. 1736) and has been the Manager of respondent's Medical Department for 12 years. She works with two other nurses (Tr. 1701). She has been with the company for 29 years. (Tr. 1696-1696). She has custody and is responsible for medical records and forms. She maintains the daily log and all tests administered (Tr. 1696). Each employee is given a pre-employment physical and then one every year [employees in Building 82 (Tr. 1712)] or two depending on their place of employment (Tr. 1697).

The daily clinic sheet is a record of employees who report with ailments such as stomach upset, headache, etc., personal matters (Tr. 1698-1699). Accident reports deal with work related injuries (Tr. 1699-1670). These reports are sent to the Safety Department and a copy to the supervisor of the department (Tr. 1702).

Prior to November 12, 1978, there was no unusual pattern of complaints from employees in Building 82 concerning any of the symptoms of carbon monoxide exposure (Tr. 1702-1704). There was an influx, six or eight, in 1978 at the time of the aborted run there. Occassionally, there would be a complaint about fumes and it would be recorded on an accident report and investigated. (Tr. 1704-1705).

---

8/ This evidence could be admissible under rule 407 of the Federal Rules of Evidence to show the feasibibility of subsequent precautionary measures. But that was not the point of the proffer. In fact, given the issue of willfulness, it was the opposite. (Tr. 1876-1880).

Prior to the accident, in November 1978, she could not recall any serious accident (death or hospitilization) as a result of exposure to the gas (Tr. 1707-1708). In 1976, one Osborn was overcome, given oxygen and bed rest, checked by Dr. Kinzly, and not hospitalized (Tr. 1708-1709). In January or February 1978, one Attfield was sent to emergency (Tr. 1709). No blood tests are given to employees complaining of the symptoms due to carbon monoxide (Tr. 1710-1711). Ann Baker in September 1979 was in Building 82, came out, got dizzy and fell. She complained of a headache. (Tr. 1746). She got aspirin (Tr. 1747). So for John Baldesaro in June 1979 who was given aspirin and had complained of the fumes (Tr. 1747-1748). So, too, for Sam Aceti in 1972 (Tr. 1748). Vivien Blen got Maalox for headache and upset stomach by Dr. Kinzly in 1979 when fumes were bad most of the morning in the building (Tr. 1749).

At one time, up to eight years ago, employees in Building 82 were given physicals every three years. Then, five years ago, these were increased to one physical every two years and in 1977, the yearly one was instituted. (Tr. 1712). Blood tests given do not include examination for carbon monoxide (Tr. 1743). Fumes never came up (Tr. 1713). If an employee complained of a headache stating it was from the fumes, he would be sent to the doctor but not automatically be given oxygen. There had to be more. (Tr. 1730-1731, 1742). The Safety Department's role is to examine the cause of any accident (Tr. 1733). She knows of no systematized course of study by Dr. Kinzly into symptoms reported by employees (Tr. 1734). Exhibit C-5-55 is a report on one Zedonis stating he was overcome by fumes in January 1970 (Tr. 1735). He fell and cut his lip for which he was treated according to the exhibit.

Dr. Robert Burns Forney is a Distinguished Professor of Toxicology and Director of the Indiana State Department of Toxicology at the Indiana Unviversity School of Medicine and has been working in this field since 1939 (Tr. 2163-2164).

Toxicology is the science of poison, the effects of it on the body, chemical analysis and its interpretation (Tr. 2164). He also functions as a forensic toxicologist who determines the legal cause of death (Tr. 2166-2167).

Mild symptomatology of carbon monoxide exposure would be headache, dizziness, nausea and fatigue. Serious symptomatology would be passing out or death. At a constant exposure of 50 ppm, the carboxy hemoglobin level would be about eight to 10 percent and some complaints would be heard. At an exposure of 200 ppm for 10 to 15 minutes, a headache is possible depending on the person. (Tr. 2170-2171). He knows of no prudent medical person who would recommend blood testing where only the mild symptomatology is present such as the medical records show here. Especially with the industrial record over the years which respondent has had (Tr. 2172, 2227-2228). Nor would it be necessary to conduct continuous monitoring; nor advise employees of the presence of carbon monoxide (Tr. 2175-2177). The instructions to employees to leave when the symptoms occur or go to medical were more than adequate (Tr. 2177).

The lunchroom where Mr. Martinkowski died, according to Dr. Forney, was a gas chamber because it trapped the gas there. Where it originated is unknown. (Tr. 2178). It could not have happened in the furnace room because of dilution (Tr. 2179-2180).

The pathologist who examined Mr. Filocamo's body did not note the color of the complexion and, therefore, could not have believed that carbon monoxide was a complicating factor (Tr. 2194-2196). But it does increase the risk of having further attacks (Tr. 2216, 2224).

The Doctor stated that some monitoring should be done to determine whether a hazard exists and the monitoring that was done yearly together with the history of the plant is sufficient (Tr. 2197, 2209). And while it may not be necessary to

advise employees about the presence of carbon monoxide, he'd be surprised if the plant manager didn't know it (Tr. 2214).

Respondent brought on Dr. James C. Miller to assess the probability of a death or serious physical injury based on information the company provided both before and after November 12, 1978 (Tr. 2256). His expertise through education, training and experience is that of an economist and probability analyst (Tr. 2257). He had all accident records and sampling data taken after the specified date. The perceived risk of death or serious injury was extemely small prior to November 1978 (Tr. 2270). After that time it was even less (Tr. 2270). Comparing the risks to the national industry averages, based on his information, would not put the company on notice that anything was amiss (Tr. 2266).

DISCUSSION, FINDINGS OF FACTS AND CONCLUSIONS OF LAW:

1] The General Duty Clause Allegations:

Items 1 and 2 of the citation are alleged violations of the general duty clause [29 U.S.C. §654(a)(1)] concerning exposure to carbon monoxide and items 3(a), (b) and (c) allege violations of 29 CFR §1910.1000 which governs the limits and conditions of exposure to that gas. These two groups (items 1 and 2 vs. 3) are mutually exclusive. Where a given regulation governs the conduct of a specific activity, it is improper to invoke the general duty clause because that was not the intent of the general duty clause, S. Rep. No. 91-1282, 91st Cong., 2d Sess. at 9, 10 (1970) and it creates problems of fair notice. Southern Ohio Building Systems, Inc. v. OSHRC, 649 F.2d 456 (1981) and Usery v. Marquette Cement Mfg., 568 F.2d 902 (1977). The specific regulation here sets the limit of exposure, requires controls to achieve that limit, and failing that, protective measures to keep employees within the limit. See 29 CFR §1910.1000(a)(2) and 1000(e). Monitors, warning systems and education of employees (the gist of items 1 and 2) are controls or protective measures going

directly to exposure to carbon monoxide and are within the ambit of the cited regulation. Citation to the general duty clause is out of place in this circumstance and items 1 and 2 are vacated in the order below.[9/]

II] Items 3(a) and 3(b), 29 CFR §1910.1000(a)(2) and (e):

These require that an employee's exposure shall not exceed 50 ppm in any eight hour shift of a 40-hour work week (footnote 3, above) and that engineering or administrative controls be determined and implemented to achieve compliance with the exposure level (footnote 4, above). Here I find:

1) Employees Farina and Martinkowski were assigned to the third shift on Saturday night, November 12, 1982; they were the only employees working in Building 82 then; and there was no supervision.

2) During the course of that shift, both men were overcome by carbon monoxide and were found in the small lunchroom which leads off the furnace room and was open to their use. The door to that room had been closed but it is unknown how the gas accumulated there or whether the room's ventilator (heater) was on or off.

3) Based on the carboxy hemoglobin levels found in their blood (55.3 percent for one and 46.2 percent for the other), their exposure exceeded the permissible level. For this, I rely on Dr. Radford's testimony that these percentages translate to an exposure of at least 1000 ppm on a time-weighted average or higher.

4) Respondent in the spring of 1978 had installed the ventilator in the lunchroom because at that time several employees had been affected there. From that time to November 12, 1978, there appears to have been no difficulty and the ventilator was designed to create a positive pressure in the room through the use of clean outside air.

---

9/ The pleading by complainant was in the alternative (Tr. 7).

5) Mr. Farina, the senior of the two employees, had received no instructions concerning the use of the lunchroom or on any precautions that must be taken in the operation of the ventilator.[10/]

With these findings, I conclude that respondent violated the cited standards. The formula for determining the time-weighted average, 29 CFR §1910.1000(d)(2)(i) and (ii), provides for peak or acute exposures as it does for less than limit levels since it seeks to determine the average over the work shift. That is, whatever the levels had been in the furnace room and lunchroom would be accounted for. Dr. Radford's extrapolation showed this to be at least 1000 ppm using the carboxy hemoglobin levels. Whether this level was achieved in the furnace room or the lunchroom, or how much each contributed to it, is unknown.

Respondent did engineer any accumulation out of the lunchroom by installation of the ventilator; but it did not implement this control through proper instruction and work rule to its employees. It did not advise them of the danger within the room although in November 1978 it was well-versed through its February 1978 experience when gasses from an aborted run on an experimental furnace accumulated in the then unventilated lunchroom. Its control and safety program failed as a result.

Respondent in its answer pleaded its third affirmative defense in terms of the alleged violation being an isolated incident of which it had no knowledge.

---

10/ There is some evidence that foremen warned employees to keep the fan on in the lavatory, also leading directly off the furnace room, because of the gas. This instruction was given at a safety meeting and whenever a foreman noticed that the fan was not operating (Tr. 68, 75, 80, 141-142, 324). But these instructions were not given concerning the lunchroom (Tr. 93). One foreman knew of no company precaution to prevent either of these ventilation systems from being turned off (Kavanaugh, Tr. 298).

This defense fails when the proof shows that an established practice (use of the ventilator) is created to prevent a violation, rules of the practice are not communicated to employees and respondent takes no steps to discover aberrations nor enforces the practice.

Whether the ventilator was working or not, whether the gas filled the lunchroom from inside the building, i.e., one recently lit furnace when emissions are high or some machinery, or was drawn in from outside, are all irrelevent if an employee has no knowledge of any safeguards he must take within the lunchroom. Otherwise, these elements may have completed the pleaded defense. Secretary v. Western Mass. Electric Company, 81 OSAHRC 63/B13, 9 BNA OSHC 1940, CCH ¶25,470. These items are affirmed in the order below insofar as they relate to the conditions at the furnace room and its attendant lunchroom, Building 82, on November 12, 1978.

III] Item 3(c), 29 CFR §1910.134(a)(2):

This standard requires the use of proper and suitable respirators to protect the health of employees when necessary. It is activated here by 29 CFR §1910.1000(e), item 3(b), which requires the use of protective equipment or protective measures if other controls do not achieve compliance. Here I find:

1) As of November 12, 1978, respondent had no personal protective equipment, masks or respirators, designed to prevent exposure to carbon monoxide to be worn as the employees went about their daily activities. There is no evidence that a type of this equipment is available for normal use rather than in an emergency application.[11/]

2) The protective measure taken by respondent was to instruct employees to get outside or to the medical department if they felt sick or otherwise were

---

11/ Equipment for use in an emergency situation was available and described by Mr. Fancourt. It was purchased by respondent after November 1978. (Tr. 502-503).

affected by the atmosphere of the furnace room. Historically, this method was used and taught to new employees either by a foreman or other employees.

The respondent has the choice between the use of protective equipment or adoption of protective measures in the event of overexposure. Complainant's burden then is to show that respondent's choice did not achieve the result; but he may not dictate which choice an employer must make in the first instance. Cf., Secretary v. Todd Shipyard Corp., 81 OSAHRC 69/A2, 9 BNA OSHC 2031, CCH ¶25,516. Thus, since this item goes to the use of respirators which is but one of two alternatives available to a respondent, and since respondent chose the other, this item is vacated in the order below.

IV] WILLFULNESS:

The issue of the effectiveness of respondent's protective measures must be decided in the context of the citation's characterization as "willful". It has been shown that the level of carbon monoxide has exceeded the time-weighted average set by the standard. It has been shown that one control installed by respondent (the lunchroom's ventilator) failed. But respondent claims that there were no signs to indicate to the prudent employer that a hazard existed in the building. Until Mr. Martinkowski, no deaths occurred in the building or in the industry from carbon monoxide; employee complaints were few; spot readings showed low levels; and "going outside" is an accepted medical practice when one encounters the symptoms caused by the gas. It claims that it was under no duty to monitor or to do any more than it did.

But 29 CFR §1910.1000(a)(2) sets a limit of exposure. Respondent knew that its process generates varying amounts of carbon monoxide. It knew that certain weather conditions affect the atmosphere within the building. It knew that employees are affected by the gas and instituted the work rule of "going outside" or to medical on those occasions. On the assumption that it was in compliance

within the limit of exposure, it did not determine whether the control it had instituted, i.e., "going outside" or to medical, was sufficient to protect employees. The time-weighted averages would have shown the respondent peaks and valleys of exposure. Knowing these, respondent could then determine what other measures, administrative controls, rules concerning the use of equipment or protective equipment, might be necessary to protect against peak exposures which could well, and have been known to, drive the average above the limit. Thus, while under no regulatory duty to monitor for the average, respondent did not do so at its peril. See, Secretary v. Anaconda Aluminum Co., 81 OSAHRC 27/A2, 9 BNA OSHC 1460, CCH ¶25,299.

A violation is willful if it is done consciously and intentionally. Secretary v. Anaconda Aluminum Co., above. A failure to take positive steps to assure compliance with a standard's requirements constitutes a careless disregard and may be characterized as willful. Secretary v. Brown & Root, Inc., 79 OSAHRC 20/A2, 7 BNA OSHC 1215, CCH ¶23,435. But a good faith attempt at compliance negates the stigma of willfulness. Secretary v. Wright and Lopez, Inc., 80 OSAHRC 36/A2, 8 BNA OSHC 1261, CCH ¶24,410.

I find:

1) Respondent has known since the inception of production that carbon monoxide is created in the process and exists in the furnace room and it has always been aware of the maximum allowable levels of exposure to employees.

2) It knew or should have known that carbon monoxide was a contributing factor in the death of Guiseppe Filocamo in 1956 because its Medical Director suspected it, saw symptoms and ordered a blood test done which showed a carboxy hemoglobin level of 35 percent. I reject Dr. Forney's analysis of the autopsy report that the gas was not a complicating factor.

3) Respondent's Safety Department personnel, prior to November 12, 1978, took spot samples yearly or when a problem was called to its attention. No time-weighted sampling was done because that equipment was not available even though those averages are required by the OSHA standard of which respondent was well aware. Spot sample levels do not relate to time-weighted averages because of the varying conditions within the building.

4) Employees regularly suffered from the symptoms of carbon monoxide exposure in the furnace room before November 12, 1978. The foremen there were well aware of this but they and the men regarded it as a natural condition in the furnace room. They had not been instructed by respondent that carbon monoxide was present or its effects. They would not report to the medical department usually unless the condition was severe.

5) An analysis of respondent's medical records (Exhs. C-5 and C-6) prior to November 12, 1978 and going back to 1947 shows 224 complaints by employees about the symptoms of carbon monoxide exposure: headache, dizziness, nausea, or collapse. The vast bulk of these occurred during normal operations and not as the result of aborted runs or abnormal periods of the exceptional release of large amounts of gasses.

6) Respondent never investigated on a routine basis the cause of these complaints and relied on employees to tell the nurse which they did on only nine occassions of the 224. But the employees did not know that they had been exposed to carbon monoxide.

7) Respondent's Medical Director was unaware of the intensity of the exposure despite the complaints on file; and the yearly spot sampling would not reveal it. The only reliable evidence of the condition in the furnace room would

would be the time-weighted average for the normal workday as required by the standard. Respondent, prior to November 1978 did not know what this average was for any period.

8) Respondent's plant Safety Manager from August 1978 onward in the furnace room had no safety training and was unaware that the corporate Safety Director considered him responsible for discovering hazards in Building 82. Of course, he discovered none knowing of the presence of carbon monoxide but not of its dangerous potential there.

9) The potential is that the exposures, depending on the general health of a person, will induce changes in the blood vessels leading to permanent injury, personality changes and death.

10) Respondent reacted to the conditions in the furnace room not with a routine, safety-minded procedure, but only when catastrophes or extraordinary events occurred. Examples are: ventilating the lunchroom after several employees were affected; and enlarging the roof monitor in preparation for experimenting with an enlarged (double-sized) furnace. But it was only in 1977 that crane cabs operating directly over furnaces were planned to be enclosed and the engineer charged with this project had to use carbon monoxide exposure as a "crow-bar" to obtain approval from the financial department (Tr. 530-531, Exh. C-10).

11) Respondent relied almost totally on employee complaints to discover areas needing correction but within its structure no effective means were devised to accomplish this. The evidence was there, but the structure was not designed to be receptive because none of the employees including managers and foremen were advised of the dangers involved. But respondent knew of that dangerous potential yet took little and inadequate initiative.

12) Respondent's only protective measure against over-exposure, without its knowing what the level of that was, is its instruction to employees to leave the furnace room, get outside, and if that didn't help, go to medical. Dr. Radford, for complainant, stated that this is not sufficient. Immediate oxygen is required. Drs. Kinzly and Forney, for respondent, testified that this precaution is ample. But since the exposure, in a very short time, can lead to collapse, an employee may not be able to comply with the instruction. Instances of this have occurred prior to November 12, 1978. That condition results from carboxy hemoglobin levels between 30 and 40 percent, or on a time-weighted average, well over 50 ppm. Thus, this protective measure must be found as insufficient.

13) Natural ventilation as it existed in Building 82 up to the time of the Trondheim report in 1979 was the state of the art of ventilation in silicon carbide furnace rooms. No mechanical ventilation system was known that could be more effective. The so-called two-layer system perfects natural ventilation but even that is still being tested. Giving the respondent the benefit of every doubt, it became involved and interested in the testing of the new system before the OSHA inspection in 1978 and implemented every recommendation of the Trondheim group practically as soon as it was made after the accident. But...

14) Because respondent did not comply with the OSHA standard to determine definitively the level of exposure in the furnace room until after the fatality, it did not, it could not have implemented any administrative controls to regulate the exposure of employees to within prescribed levels on the assumption that no feasible engineering controls were available to it. Respondent assumed, without the accurate information required by the standard, that it was in compliance and

did not equip the furnace room with monitors and alarms to warn employees of dangerous emissions. Thus, there is no continuity of activity to show a good faith attempt to control exposures until the engineering procedures were perfected.

On these findings, I conclude that the violations are properly characterized as willful. There is no showing of any valid, positive steps taken to assure compliance to prevent employees from being exposed beyond the standard's limit on a time-weighted average. Where the onus of determining the exposure is placed by the standard on respondent, its practically total reliance on employees' complaints, pain and death to determine levels of exposure can hardly be termed as a good faith effort at achieving compliance. Rather, it amounts to a conscious disregard of the standard's mandate.

V] PENALTY:

The penalty for a willful violation may be up to $10,000, 29 U.S.C. §666(a), depending on respondent's size, the gravity of the violation, respondent's good faith and the history of previous violations, 29 U.S.C. §666(i).

Respondent is the largest producer of silicon carbide in the country operating six plants and in 1979 the sales' value of the product was over $4.5 million produced in Building 82 alone. This factor does not affect the penalty assessment.

The gravity of the violation is evident. Death or serious bodily harm; exposure over entire shifts. Respondent knows of this consequence and with reasonable diligence would have known by proper testing and sampling where, when and under what stage of the production process an employee is vulnerable. Thus, the violation may also be termed serious, 29 U.S.C. §666(j) and with 34 employees affected on the three shifts the gravity is high.

As noted above, there is little here to commend respondent's good faith. The effort it made to determine the actual conditions in the furnace room and to alleviate them are nil. Cf., Secretary v. S. Zara Contracting Co., 82 OSAHRC 5/C9, 10 BNA OSHC 1334, CCH ¶25,891.

Respondent's Vancouver, Washington plant, similar to the one at issue here was cited in 1977 and 1978 by that State's Division of Industrial Safety and Health (Exh. C-16, Tr. 672). Correction of those conditions dealing with enclosing crane cabs was undertaken (Exh. C-25). History of respondent has little affect on the penalty assessment. No previous OSHA citations were brought out.

With the gravity high and the good faith low, I conclude that a civil penalty in the amount of $10,000 is appropriate.[12/]

ORDER

In determining the above findings and conclusions, I have considered the parties' post-hearing filings. To the extent shown I have adopted their proposals. Otherwise, these are rejected as having no support in fact or law; and it is ORDERED that the citation issued January 22, 1979, alleging a willful violation of

(1) 29 U.S.C. §654(a)(1), item 1, and

(2) 29 U.S.C. §654(a)(1), item 2

are vacated;

(3) 29 CFR §1910.1000(a)(2), item 3(a) and 29 CFR §1910.1000(e), item 3(b)

are affirmed as a single violation with a civil penalty of $10,000 assessed

---

12/ Thus complainant's motion, contained in the Post-Hearing Memorandum (page 6), to adjust the penalty is, to the extent requested, granted.

therefor; and

(4) 29 CFR §1910.134(a)(2), item 3(c)

is vacated.

ATLANTA, GEORGIA 30309

# NOTICE OF DECISION

SECRETARY v. MILLER WELL SERVICE, INC.

OSHRC Docket No. 81-2373

1. Enclosed is a copy of my decision. It will be filed with the Commission on July 27, 1982, and will become the final order of the Commission on August 26, 1982, unless a Member of the Commission directs that it be reviewed.

2. You may petition for discretionary review of this decision by the Commission. A petition may be filed directly with me within twenty (20) days from the mailing of my decision. Thereafter, a petition should be mailed to the Executive Secretary, Attention:

   Chief Review Counsel
   Occupational Safety and Health Review Commission
   1825 K Street, N. W., Suite 601
   Washington, D. C. 20006

   Any petition filed directly with the Commission will be considered to the extent that time and resources permit. The last day the Commission may consider your petition is August 26, 1982. This final order date is fixed by law and cannot be extended under any circumstances.

3. If review is ordered by a Member of the Commission, each party to this case will be notified. In addition, each party will be given an opportunity to submit a brief to the Commission.

4. Please complete the enclosed postcard indicating whether you presently intend to seek review of this decision and mail the completed card promptly. Your response does not bind you in any way, but it assists the Commission in processing your petition when it is filed.

5. For any further details on the review process, see Commission Rules 90, 91, 92, and 93.

APPEARANCES:

Max A. Wernick, Esquire, Office of the Solicitor, U. S. Department of Labor, Dallas, Texas, on behalf of complainant

George R. Carlton, Jr., Esquire, Dallas, Texas, on behalf of respondent

## DECISION AND ORDER

SALYERS, Judge: Miller Well Service, Inc., is a corporation engaged in the well servicing business. On September 10, 1981, the respondent was investigated by a compliance officer of the Occupational Safety and Health Administration at a site located near Kilgore, Texas. As a result of this investigation, the respondent was issued one serious citation consisting of four items and one other than serious citation under the provisions of the Occupational Safety and Health Act (29 U.S.C. 651, et seq.). On October 2, 1981, respondent served notice that it intended to contest all citations. The case was tried in Shreveport, Louisiana, on January 28, 1982.

At the time of the inspection, respondent's employees were engaged at a work site near Highway 31 and Tucker Road in Kilgore, Texas, in servicing an oil well

owned by Amoco (Tr. 9). In use at the work site was a truck-mounted, workover rig or derrick as depicted in complainant's Exhibit 1. The rig was approximately 100 feet in height (Tr. 17). Attached to the rig were two working platforms. The first working platform, referred to as the "rod basket" in the record, is located approximately 20 feet down from the crown or top of the rig. The second platform, referred to as the "monkey board," is approximately 60 feet above the ground level (Tr. 20). Also attached to the rig is a ladder running from the ground level all the way to the top or crown of the rig. From time to time, it was necessary for employees to ascend and descend this ladder to gain access to the work platforms described above (Tr. 21). At the work site respondent had five employees, a "pusher" or superintendent and four laborers.

The Secretary charges the respondent with a violation of section 5(a)(1) of the Act, the so-called general duty clause, for exposing its employees to the hazard of being hit by a three-inch hose which was not safety chained at its connection to the standpipe at the rig. This hose was a flexible hose and was being used to pump salt water under 250 pounds of pressure into the well (Tr. 29). The connection point of the hose and the standpipe was approximately 30 feet above ground level (Tr. 30). The compliance officer speculates that, because the water was being pumped under pressure, there was a possibility that the hose might become separated from the standpipe or rupture and fall on employees at ground level (Tr. 24).

To establish a violation of section 5(a)(1) of the Act, the Secretary must prove (1) that the employer failed to render its workplace free from a hazard which was (2) recognized, (3) the occurrence of an incident was reasonably foreseeable, and (4) the likely consequences in the event of an incident was death or serious physical harm to its employees. Western Massachusetts Electric Co., 81 OSAHRC 63/B13, 9

BNA OSHC 1940, 1981 CCH OSHD ¶ 25,470 (No. 76-1174, 1981); Bomac Drilling Division of TRG Drilling Corp., 81 OSAHRC 45/A2, 9 BNA OSHC 1681, 1981 CCH OSHD ¶ 25,363 (No. 76-450, 1981).

The compliance officer in this case, Walter C. Hogan, Jr., has considerable experience in the well drilling field, covering a period of some 18 to 20 years (Tr. 10). However, his experience relative to the type of operation here involved is somewhat limited since he has made only seven or eight inspections of rigs being used to circulate water (Tr. 33, 40). His testimony concerning the potential hazard of the hose becoming separated from the standpipe or rupturing, as well as his testimony concerning possible injuries to employees in the event of such an occurrence, is not convincing. The well in question is a shallow well, and the operation in progress required only minimal pressure on the hose which had a bursting capacity of 10,000 pounds (Tr. 41). The hose was clamped or threaded onto the standpipe (Tr. 42), and there is nothing in the record to suggest that the coupling was defective. If the coupling began to unscrew or come loose, leaks would occur which would give employees ample notice of the problem before complete separation occurred (Tr. 44). Even in the event of separation, it is open to question that employees would be hit by the hose or, if hit, would be seriously injured (Tr. 47).

In contrast to the equivocal testimony of Mr. Hogan, respondent presented the testimony of James W. Miller, its president. Mr. Miller has been in the well servicing business for 23 years, holds a degree in petroleum engineering, and is a professional petroleum engineer (Tr. 113-114). His testimony confirms that the hose in question operating at a pressure of 250 pounds presented no danger of a rupture of the hose or the uncoupling of the hose from the standpipe (Tr. 115-119). In his

many years of experience, he has never known of such an occurrence (Tr. 117). In short, his testimony is both credible and convincing. The citation relating to the hose will be vacated.

Citation No. 1, item 2, charges respondent with a serious violation of 29 C.F.R. § 1910.27(d)(2).[1/] On the day of the inspection, Mr. Hogan observed a derrickman standing on the "monkey board" approximately 60 feet above ground level. As Mr. Hogan watched, the derrickman descended the fixed ladder attached to the rig to the ground level (Tr. 55). The employee was not wearing or using a ladder climbing device (Tr. 56). The evidence is undisputed that this fixed ladder did not have the landing platforms required by the standard (Ex. C-1-H). Accordingly, this citation will be affirmed.

There was sharp dispute at the hearing concerning the validity of serious Citation No. 1, item 3, which charges respondent violated 29 C.F.R. § 1910.36(b)(2).[2/] At the beginning of the hearing, the Secretary moved to amend his

---

1/ 29 C.F.R. § 1910.27(d)(2) provides:

> (2) Landing platforms. When ladders are used to ascend to heights exceeding 20 feet (except on chimneys), landing platforms shall be provided for each 30 feet of height or fraction thereof, except that, where no cage, well, or ladder safety device is provided, landing platforms shall be provided for each 20 feet of height or fraction thereof. Each ladder section shall be offset from adjacent sections. Where installation conditions (even for a short, unbroken length) require that adjacent sections be offset, landing platforms shall be provided at each offset.

2/ 29 C.F.R. § 1910.36(b)(2) provides:

> (2) Every building or structure shall be so constructed, arranged, equipped, maintained, and operated as to avoid undue danger to the lives and safety of its occupants from fire, smoke, fumes, or resulting panic during the period of time reasonably necessary for escape from the building or structure in case of fire or other emergency.

complaint to allege this charge in the alternative as a violation of section 5(a)(1) of the Act. Apparently, at the time the citation was issued, the Secretary's agents were unaware of OSHA Program Directive No. 100-67 issued August 15, 1977. This directive exempts workover rigs used to service oil wells from application of the cited standard and directs that such rigs be cited under the "general duty clause" where rigs have no means of egress or inadequate means. Respondent opposed the Secretary's motion on grounds that it was untimely filed and the granting of the motion would seriously prejudice respondent's right to prepare a proper defense to the new charge. The motion was reluctantly granted after advising respondent it could renew the objection at the conclusion of the hearing and, should it appear respondent had been prejudiced by the amendment, respondent would be afforded a supplemental hearing to present its defense (Tr. 6-7).[3/] Since it appears the Secretary's agents acted contrary to his own directive in citing under the standard, the evidence will only be considered as it relates to the "general duty" charge. The elements of such a charge have already been noted.

The crux of the Secretary's charge is that respondent's rig did not afford employees engaged on the work platforms a proper means of egress in the event of an emergency; i.e., fire, blowout, explosion, etc. The means of abatement recommended by the Secretary was the use of a Geronimo slide line. This would require attaching a wire rope from the work platforms and securing the rope at ground level at an angle of approximately 45 degrees (Tr. 136). Attached to this rope at the work platform would be a trolley or sliding device which could be used

---

3/ Respondent renewed the objection at the end of the hearing and was advised he would be granted a supplemental hearing upon request. Counsel for respondent requested time to discuss this with his client (Tr. 139). No request for a supplemental hearing was made.

by employees engaged on the platform to rapidly descend from the platform in the event of an emergency (Tr. 67). Although the respondent had such a device at the work site, it had not been hooked up (Tr. 68; Ex. C-1-J).

Respondent attacks the Secretary's position on two grounds. Respondent avers that the possibility of a blowout or gas kick at this particular site was highly unlikely due to the nature of the operation (Tr. 126) and the low pressure in the well (Tr. 129). A distinction is drawn between drilling wells where the conditions to be encountered are unknown and servicing a well "where you know what's there" (Tr. 76). Some support for this contention is given in the testimony of the compliance officer:

> Q. All right. And the job that they were doing, pulling the rods out, this does not entail any formation work, does it not, such as fracturing?
>
> A. That's true, sir.
>
> Q. So you are not messing with the formation itself?
>
> A. That's right.
>
> Q. So would you agree that it is rather remote to have a blowout on a shallow East Texas well on a pump?
>
> A. That I would have to admit, sir.
>
> Q. And a gas kick is more or less a condition of drilling more than anything. When you are drilling, you hit a gas pocket and out it comes.
>
> A. Well, as a general rule, you think of that. But I would say on these East Texas wells you can have a gas kick, yes, sir.
>
> Q. Would you also agree that it is extremely unlikely in this kind of well?
>
> A. Yes, sir. It is not the norm, I'll admit. (Tr. 81-82)

In addition to the remoteness of a hazard, respondent also contends the guy wires attached to the rig would provide an acceptable alternative to the use of a

Geronimo device. Once again, support for this position is provided in the testimony of the compliance officer:

> Q. For the record, I'm referring to photograph C in Complainant's Exhibit No. 1, showing a line going out at an angle from the tubing board; is that correct?
>
> A. Yes, sir. Guy lines, yes, sir.
>
> Q. All right, sir. That's, again, nothing but a wire rope, is it not?
>
> A. That's true.
>
> Q. All right, sir. And isn't it also a fact that, let's say before the advent of OSHA, for the past 50 years derrickmen have gotten out of the derrick by simply taking their safety belt and sliding down the guy wires?
>
> A. That has been done.
>
> Q. And it was done as the norm until OSHA came along, wasn't it?
>
> A. Yes, sir.
>
> Q. Okay. So although OSHA would say that there are better ways to do it, there is a way out of that derrick by simply throwing your safety line over it and coming down the guy wires.
>
> A. Could be done. (Tr. 83-84)

The alternate method of using the guy wires for quick descent is not without some hazard since an employee might fall while trying to hook on (Tr. 85), but the same hazard is presented in using the Geronimo device (Tr. 86).

After careful consideration of the record, I find that the Secretary has not established a violation of the general duty clause of the Act.

Serious Citation No. 1, item 4, charges respondent with violating 29 C.F.R. § 1910.132(a)[4/] for failure to enforce the wearing of protective footwear. The

---

4/ 29 C.F.R. § 1910.132(a) states:

> (a) Application. Protective equipment, including personal protective equipment for eyes, face, head, and extremities, protective clothing, respiratory devices, and protective shields and barriers, shall

evidence is undisputed that on the date of the inspection, the compliance officer observed two employees wearing shoes which did not meet the requirements of the standard (Tr. 87-88). It is also undisputed that company policy requires the wearing of such equipment while working around the rig (Tr. 89, 132). As soon as this matter was called to the attention of the employees, both employees obtained proper shoes and wore them throughout the balance of the inspection (Tr. 91). While the fact that a violation occurred cannot be ignored, the gravity of this violation and its short duration dictate a find that the charge should be reduced to other than serious with no penalty assessed.

Finally, respondent was charged with a violation of 29 C.F.R. § 1910.151(b)[5/] for failure to have persons at the work site who were adequately trained to render first aid. Upon his arrival at the site, the compliance officer asked all employees if any of them had "a current first aid card" (Tr. 94). When he got a negative response, he pursued the matter no further. (Id.) None of the employees were asked the definitive question as to whether they had first aid training. (Id.) When asked why this question was not put to employees, the compliance officer responded:

---

4/

be provided, used, and maintained in a sanitary and reliable condition wherever it is necessary by reason of hazards of processes or environment, chemical hazards, radiological hazards, or mechanical irritants encountered in a manner capable of causing injury or impairment in the function of any part of the body through absorption, inhalation or physical contact.

5/

29 C.F.R. § 1910.151(b) states as follows:

(b) In the absence of an infirmary, clinic, or hospital in near proximity to the workplace which is used for the treatment of all injured employees, a person or persons shall be adequately trained to render first aid. First aid supplies approved by the consulting physician shall be readily available.

> THE WITNESS: Well, a person may actually be eminently qualified, but we only recognize qualification by virtue of a recognized training course by the American Red Cross, Bureau of Mines, or some other accredited or accepted course of instruction as proof that the man is qualified. In other words, it is a matter of proof. You may actually have somebody there that is. If I could determine that he was proficient, well, I'd probably still have to write it up that they didn't have these accepted proofs of training. But I'd probably put it in there that so and so and so and so was qualified by virtue of whatever. (Tr. 95)

In a charge under this standard, the Secretary must do more than merely establish that no employee had an approved first aid card. He must establish that no employee was "adequately trained to render first aid" which is all the standard requires. The Review Commission has recently sustained this position. Snyder Well Servicing, Inc., 82 OSAHRC 10/C5, 10 BNA OSHC 1371, 1978 CCH OSHD ¶ 22,912 (No. 77-1334, 1978).

## FINDINGS OF FACT

1. Respondent, Miller Well Service, Inc., is a corporation engaged in well servicing operations. At all times pertinent hereto, the respondent had employees handling or working on goods that are moved in interstate commerce.

2. On the date of the inspection, respondent had five employees engaged in operating a truck-mounted, workover rig in connection with the servicing of a well located near Kilgore, Texas. The rig was approximately 100 feet high and had two work platforms attached at heights of 60 and 80 feet above ground level. The rig had a fixed ladder running from the ground level to the crown of the rig.

3. In use at the rig was a flexible three-inch hose for pumping salt water under 250 pounds of pressure. This hose was connected to a standpipe at an elevation of 30 feet above ground level. The hose was clamped or threaded onto

the standpipe, and the evidence does not reflect there was any hazard of this hose becoming ruptured or disconnected from the standpipe.

4. The fixed ladder attached to the rig did not have landing platforms at intervals of 20 feet nor did the respondent enforce the use of protective devices when employees ascended or descended the ladder.

5. Due to the nature of the operation conducted by respondent, the possibility of a blowout or gas kick was extremely remote. In the event of such an occasion, guy wires attached to the rig were sufficiently adequate to provide a means of egress.

6. On the day of the inspection, two employees were observed to be wearing inadequate foot protection. This situation was immediately corrected when called to the attention of respondent's supervisor.

7. The Secretary has failed to establish that respondent had no one at the jobsite who was adequately trained to render first aid.

## CONCLUSIONS OF LAW

1. Respondent is an employer engaged in a business affecting commerce, and the Occupational Safety and Health Review Commission has jurisdiction of this case.

2. Respondent did not violate the provisions of section 5(a)(1) of the Act, 29 C.F.R. § 1910.36(b)(2) or 29 C.F.R. § 1910.151(b).

3. Respondent violated the provisions of 29 C.F.R. § 1910.27(d)(2) by failing to provide landing platforms on a fixed ladder or requiring employees to use protective devices when ascending or descending the ladder.

4. Respondent violated the provisions of 29 C.F.R. § 1910.132(a) by failing to insure employees wore appropriate protective equipment.

## ORDER

1. Serious Citation No. 1, items 1 and 3, are vacated.

2. Serious Citation No. 1, item 2, is affirmed and a penalty of $100.00 is assessed.

3. Serious Citation No. 1, item 4, is reduced to other than serious and no penalty is assessed.

4. "Other" than serious Citation No. 2, item 1, is vacated.

Dated this 27th day of July, 1982.

Cleveland, Ohio
for the Respondent

Usher, Judge:

This is a proceeding initiated by the Secretary of Labor, United States Department of Labor, pursuant to Section 10(c) of the Occupational Safety and Health Act of 1970 (29 U.S.C. 651, et seq., hereinafter referred to as the Act) seeking affirmance by the Review Commission of a citation which charges a "nonserious" violation of Section 5(a)(2) of the Act because of Respondent's alleged noncompliance with the occupational safety and health standard promulgated by the Secretary

and codified at 29 Code of Federal Regulations, Section 1910.95(b)(1).[1/]

The citation resulted from an inspection of Respondent's plant at 901

---

1/ The standard set forth at 29 CFR 1910.95 provides (in pertinent part):

> (a) Protection against the effects of noise exposure shall be provided when the sound levels exceed those shown in Table G-16 when measured on the A scale of a standard sound level meter at slow response. When noise levels are determined by octave band analysis, the equivalent A-weighted sound level may be determined as follows: [Figure G-9 omitted].
>
> (b)(1) When employees are subjected to sound exceeding those listed in Table G-16, feasible administrative or engineering controls shall be utilized. If such controls fail to reduce sound levels within the levels of Table G-16, personal protective equipment shall be provided and used to reduce sound levels within the levels of the table.
>
> (2) If the variations in noise level involve maxima at intervals of 1 second or less, it is to be considered continuous.
>
> (3) In all cases where the sound levels exceed the values shown herein, a continuing, effective hearing conservation program shall be administered.

TABLE G-16--PERMISSIBLE NOISE EXPOSURES

| Duration per day, hours | Sound level dBA slow response |
|---|---|
| 8 | 90 |
| 6 | 92 |
| 4 | 95 |
| 3 | 97 |
| 2 | 100 |
| 1 1/2 | 102 |
| 1 | 105 |
| 1/2 | 110 |
| 1/4 or less | 115 |

Exposure to impulsive or impact noise should not exceed 140 dB peak sound pressure level.

Lakeside Avenue, Cleveland, Ohio, by Complainant's agent on March 7, 1975. The alleged violation was described in the citation as follows:

> Failed to use feasible administrative or engineering controls to reduce the sound levels within the permissible limits, in the Press room on number 1 and number 9 presses.

A March 31, 1977, abatement date was required by the terms of the citation. No penalty was proposed by Complainant's agent.

Respondent duly contested the citation, pursuant to Section 10(c) of the Act, and a complaint and answer followed. The issues were tried before the undersigned on December 16, 17 and 18, 1975, and April 6, 1976.

## PLEADED AND STIPULATED FACTS

Respondent has admitted its corporate status, its employment of employees, and its engagement in interstate commerce. It is "engaged in...printing daily newspapers,...employs approximately 1,300 employees... and shipments are received from and transmitted to points outside of Ohio," as admitted in the answer.

## THE ISSUES

The pleadings, the evidence adduced by the parties, and the briefs filed herein serve to raise the following basic issues:

1) Is the standard codified at 29 CFR 1910.95 constitutionally "unreasonable, arbitrary or capricious" as not "bearing a rational relationship between the statutory goal of safe and healthful working conditions and the requirement of the Regulation that an employer...attempt to remove excessive noise from the working environment, rather than protecting his employees with personal protective equipment?"

2) Were one or more of Respondent's employees exposed to noise levels in excess of those permitted by the standard?

3) Do feasible engineering or administrative controls exist which would effect attenuation of the noise levels and thus bring them within the range set forth in the standard?

## VALIDITY OF THE STANDARD

Respondent argues that the Review Commission has, or ought to have, the power to adjudge the subject standard to be "an invalid exercise of power by the Secretary of Labor." I agree as has the Review Commission on several occasions. See Secretary of Labor v. Castle and Cooke Foods, Inc., OSHRC Docket No. 10925, 5 BNA OSHC 1435 (May 19, 1977) and cases cited therein.

It is Respondent's position that the Secretary exceeded his statutory authority when he promulgated the standard which has been codified at 29 CFR 1926.95(b)(1) because there is no "rational relationship between the statutory goal...and the requirement of the Regulation...rather than [an employer] protecting his employees with personal protective equipment...." The Commission has rejected this and similar attacks upon the validity of the standard in question, and Respondent's argument is likewise rejected here. Secretary of Labor v. Turner Company, OSHRC Docket No. 3635 CCH OSHD para. 21,023 (August 24, 1976); Secretary of Labor v. Castle and Cooke Foods, Inc., supra.

## DISCUSSION OF THE EVIDENCE

Complainant adduced the testimony of several expert witnesses and introduced various exhibits. Respondent offered no testimony, relying instead on the assertion that Complainant had not established a prima facie case.

The testimony of Complainant's agent, Earl Gregory, an industrial hygienist, (hereinafter referred to as the Compliance Safety and Health Officer or "CSHO") served to establish the facts which formed the basis for the citation. Using a General Radio sound level meter and audio dosimeters he monitored the noise levels to which two of Respondent's employees were exposed during their workday on March 7, 1975. These employees worked as "folder operators" and tended the folding operation as the newspapers came off the press. With the sound level meter he recorded noise levels ranging from 85 dBA to 103 dBA while the folder on Press No. 1 was in operation and calculated a time-weighted average of exposure from these readings. The resulting exposures were then compared with the readings of the dosimeter on each of the two employees. (Exhibits C-2 through C-8.)

It will suffice to say that the CSHO's testimony was entirely credible, and the results of his survey on March 7, 1975, are accepted as fact.

While not conceding the accuracy of these investigation findings, Respondent seemingly did not contest seriously the conclusion that two of its employees were exposed to noise levels which exceed those allowed by the standard. Respondent did object strenuously to any conclusions which were based upon dosimeter readings. However, that argument must fall when it is noted that basically the same conclusions are reached whether the sound level meter readings or the dosimeter readings are used to establish the fact that excessive noise exposure was experienced by the employees.

Complainant sought unsuccessfully to adduce the CSHO's testimony regarding the existence of feasible administrative or engineering controls to abate the noise problem in the pressroom at Respondent's plant. The witness admittedly had no experience in the newspaper printing industry and had only limited experience in the field of noise attenuation in general.

The testimony of Robert Feaster was adduced by Complainant. Mr. Feaster is the pressroom superintendent at the Lansing State Journal, a newspaper printing and publishing firm in Lansing, Michigan.

According to Mr. Feaster the presses at the Lansing State Journal are "Goss Headliner, Mark II" presses, and there are eight black "printing units" and six colored "printing units" in the pressroom there. Each printing unit or press has two folders which are attached to or run in conjunction with the presses.

The Goss Printing Press Company (manufacturer of the equipment in use at the Lansing State Journal) installed folder enclosures in early 1973. The witness described these enclosures which were installed for the purpose of attenuating the noise emanating from the folders. According to the testimony, the enclosures did in fact accomplish the intended purpose.

Complainant adduced the testimony of Robert Kiamko,[2/] a senior project engineer at the Goss Printing Press Company (a division of Rockwell International), who conducted a test project for the installation of the folder enclosures at the Lansing State Journal in 1972 and 1973. The witness described the folder enclosures in some detail and testified

2/ "Robert Kiomko" in the transcript.

regarding their effectiveness in attenuating the noise emanating from the folders at the Lansing plant. He described in great detail the testing by which the results were obtained, but admitted that the printing equipment used at Lansing and the conditions of its use were different from those at Respondent's plant. He had not visited the pressroom at the Cleveland Press. However, he understood (from the CSHO's testimony) that the situation there was unlike that at Lansing. Admittedly, according to the witness, the folder enclosures which were installed at Lansing could not be used at the Cleveland Press plant.

Mr. Robert Newson,[3/] President of Noise Engineering, Inc., testified at the behest of Complainant. His firm "designs, manufactures and installs noise abatement systems...specializ[ing] in the industrial noise market."

The witness described "personnel enclosures" and "folder enclosures" which he has either designed and constructed at various newspaper printing plants or which he has observed being used in such workplaces. The former are enclosures "in which...employees...seek shelter from adverse noise conditions" and the latter are, as the term implies, enclosures for the folder which is apparently the equipment that is the most offensive insofar as noise in a pressroom is concerned. He identified specific newspaper printing plants in Dallas, Austin and Houston (Texas), Phoenix and Tucson (Arizona), San Jose, Palo Alto, Berkeley, and Costa Mesa (California), Atlanta (Georgia) and New Orleans (Louisiana) where such studies or installations were made. At several

3/ Sometimes spelled "Newsom" in the transcript.

of these plants the witness has made proposals for noise attenuation which have not been adopted; at others he has made proposals which have been carried out by the newspaper printing firms; and at still others he has been employed to implement the proposed installations. The witness testified regarding the cost, or estimated cost, of the several installations, or proposed installations, with which he was intimately familiar.

Complainant introduced several documents (reports, publications, etc.) in which were recounted the facts and circumstances surrounding the design and installation of enclosures in newspaper printing plants. See Exhibits Nos. C-9 through C-23. These reports deal, for the most part, with the enclosure installed at the Lansing State Journal.

EVALUATION OF THE EVIDENCE

It is now well settled that Complainant bears "the burden of proving all elements of an alleged violation...." See Commission Rule 73(a); Secretary of Labor v. OSHRC and Raymond Hendrix, etc., 511 F.2d 1139 (9th Cir. 1975); and Secretary of Labor v. Wheeling-Pittsburgh Steel Corporation, OSHRC Docket No. 13949 (May 13, 1977) and the other cases cited therein. "The standard of proof...is the preponderance of the evidence rule." Secretary of Labor v. OSHRC and Raymond Hendrix, etc., supra.

Thus, it is Complainant's burden to prove, initially, that one or more of Respondent's employees were exposed to levels of noise at the workplace which exceeded those specified in the safety and health standard, and, secondly, to prove by a preponderance of the evidence that "particular controls [are] feasible to reduce noise at the work site involved." Secretary of Labor v. Wheeling-Pittsburgh Steel Corporation,

supra. The feasibility of the administrative or engineering controls contemplated by the standard includes, the Commission has said repeatedly, engineering feasibility as well as economic feasibility. See, e.g., Secretary of Labor v. Continental Can Company, Inc., OSHRC Docket Nos. 3973, etc., CCH OSHD para. 21,009 (August 24, 1976).

The evidence adduced by Complainant through his CSHO suffices to meet his initial burden. Using a carefully calibrated sound-level meter, Complainant's agent measured the sound--emanating particularly from the presses and the folder--as it reached the ears of two of Respondent's employees. He calculated the periods of time when these employees were exposed to the measured noise levels and correctly concluded that the employees' exposure exceeded that which is allowed by the terms of the safety and health standard. The CSHO then checked his calculations with readings recorded on audio dosimeters which were worn by the two employees. These readings confirmed the conclusion that excessive noise exposure was encountered by the employees in question.[4/]

Turning to the question of the feasibility of engineering controls to reduce the exposure of Respondent's employees in its pressroom, the testimony of the CSHO, Earl Gregory, the pressroom superintendent at the Lansing plant, Robert Feaster, the project engineer at Rockwell, Robert Kiamko, and the noise control consultant, Robert Newson, must be weighed in light of the Commission's decisions on the subject.

---

4/ Respondent's objection to testimony concerning the dosimeter readings was overruled. The Commission has held that "the use of an audio dosimeter for measuring this exposure is not precluded by section 1910.95(a). ...the standard does not require the use of a standard sound-level meter as the exclusive measuring instrument." Secretary of Labor v. Love Box Company, OSHRC Docket No. 6286, CCH OSHD para. 20,588 (April 7, 1975).

Mr. Gregory is the only one of Complainant's four witnesses who has visited Respondent's plant. The purpose of his visit was to monitor the noise levels to which Respondent's employees in the pressroom were exposed and to determine whether or not compliance with the applicable standard was being achieved. Inasmuch as the standard requires the use of administrative[5/] or engineering controls when certain noise exposure is found to exist, Mr. Gregory's duties included a determination of the feasibility of such controls.

The reported results of Mr. Gregory's monitoring of the exposure of Respondent's folder operators to excessive noise levels fully demonstrates his expertise in the field of sound measurement, and his findings as to that fact have been accepted. On the other hand, examination and cross-examination of this witness clearly evidenced the fact that he has no expertise in the highly technical field of noise attenuation in a newspaper printing company's pressroom.

Mr. Feaster's qualifications as a pressroom superintendent were fully set forth in his testimony and his expertise in that field of endeavor is not questioned. The witness was present at the Lansing plant while noise attenuation studies were conducted there by engineers of the Goss Printing Press Company, and he and his subordinates did perform some of the actual construction of the enclosures "with the supervision of Goss engineers." He "worked with the engineers more as a critic," rejecting ideas which "you couldn't live with." He apparently observed the construction of the folders at the Lansing plant on a daily basis, but participated in the installation only to the

5/ Complainant has adduced no evidence regarding the feasibility of any administrative controls. Thus, only the existence of feasible engineering controls need be determined.

extent that the physical structures might or might not be practical from the point of view of allowing for the performance of the required work.

Mr. Feaster explained in some detail the physical characteristics of the Lansing plant and described the Goss presses used there. He admittedly had no knowledge of the physical layout at Respondent's plant. He had never visited the pressroom at the Cleveland Press and was able to add nothing to enlighten the trier of fact as to the question of the feasibility of engineering controls to reduce noise exposure at Respondent's work place.

Robert Kiamko has earned a Master's Degree in Mechanical Engineering and is presently employed by the Goss Printing Press division of Rockwell International Corporation. He specializes, apparently among other things, in the attenuation of noise emanating from printing presses and the folding equipment which is attached to, or operated in conjunction with, such presses. He was charged with the responsibility of designing and constructing the enclosures and unit baffles on equipment at the Lansing State Journal in 1972 and 1973. According to the testimony this noise reduction project was largely successful.

This witness admitted that he has not seen and is not at all familiar with the equipment, physical layout, or operations at Respondent's plant. His understanding is that Respondent's plant is equipped with presses and folding units manufactured by the Hoe Company and that the press rooms are dissimilar to those at Lansing. Because of his lack of knowledge of the conditions which exist at Respondent's plant, Mr. Kiamko was admittedly unable to state with any degree of certainty whether

there exist engineering controls for the attenuation of noise levels at Respondent's plant which are feasible, either technologically or economically.

Taken in the context most favorable to Complainant's position, this witness' testimony served only to establish the fact that there is a technological capability to design, construct and install engineering controls to reduce noise levels in the pressrooms of newspaper printing plants.

The testimony of Mr. Robert Newson, which was adduced by Complainant, further established the conclusion which Mr. Kiamko reached.

Respondent rejects Mr. Newson's purported qualifications as an expert in the field of noise attenuation in the pressrooms of newspaper publishing firms. The record reveals an opposite conclusion. Nevertheless, this witness' expertise in the field generally has little value when it is sought to be utilized to resolve the ultimate question obtaining under the facts in this case. The witness is totally unfamiliar with the layout, design, and operation of the pressroom at Respondent's plant, save the limited knowledge he gained from hearing and evaluating the testimony of the CSHO and viewing various selected exhibits, e.g., a diagram of the plant.

Mr. Newson testified regarding noise suppression enclosures in general. He spoke with considerable knowledge about the installation of such devices at various newspaper plants where he had been involved in the installation, where he had considered the feasibility of such installations, or where he had studied the results of similar attempts at

noise attenuation. Noticeably this witness' testimony lacked probative value because of his confessed lack of knowledge of the size, shape, configuration and design of Respondent's workplace. The strictures placed upon his opinions by his lack of knowledge about Respondent's pressroom rendered his testimony valueless as to the ultimate issue involved here.

Mr. Newson's testimony did serve, however--as did Mr. Kiamko's--to establish the fact that present technology permits attenuation of employee noise exposure in newspaper pressrooms under certain circumstances through the employment of engineering devices.[6/]

Complainant argues that the trier of fact should be able to extrapolate, using the various descriptions of solutions which his witnesses adduced, and apply those to the somewhat vaguely described physical conditions which exist at Respondent's plant. In such a highly technical situation as is here presented that is a hopeless impossibility. The suggestion amounts to nothing more than a futile attempt to substitute the known for the unknown in order to compensate for the obvious absence of proof which is required of Complainant.

The Review Commission has spoken to the question presented here on several recent occasions. See, for example, Secretary of Labor v.

---

6/ Thus, it cannot be decided, on the basis of the facts adduced here, whether or not feasible engineering controls exist which would sufficiently attenuate the noise levels at Respondent's pressroom to effect compliance. What is decided here is that Complainant has not met his burden of proof as to that issue.

Reynolds Metal Company, OSHRC Docket No. 1551, CCH OSHD para. 20,447 (February 26, 1976); Secretary of Labor v. Great Falls Tribune Company, OSHRC Docket No. 6632, 5 BNA OSHC 1443 (May 19, 1977); and Secretary of Labor v. Castle and Cooke Foods, Inc., supra.

Here, as in Reynolds, supra, "[t]he testimony of Complainant's expert shows only that general techniques to reduce noise [in newspaper publishers' pressrooms] exists. It does not show that any particular controls are feasible to reduce the noise in [Cleveland Press'] plant."

As in the Great Falls Tribune case (supra), Complainant here engaged experts who are familiar with the results of the engineering controls which have been successfully employed at the Lansing State Journal pressroom at Lansing, Michigan. There, according to the facts recited by the Review Commission in the Great Falls Tribune decision, "the pressroom...represented the highest state of the art among newspapers in achieving compliance with the...noise standard through the use of engineering controls." The expert who testified in the Great Falls Tribune case had inspected and studied the pressrooms at both locations. In this instance, however, Complainant sought only to adduce disjointed factual assertions and leave to conjecture whether or not those pieces of the puzzle might or might not fit.

"[Complainant's] burden is not satisfied simply by a showing that general noise controls exist. The standard is only violated if an employer fails to utilize those controls which are feasible in its

operations" Secretary of Labor v. Great Falls Tribune Company, supra. Complainant has failed to carry his burden. There has been no showing that the engineering controls described by Messers Feaster, Kiamko, or Newson are feasible, either technologically or economically, for implementation at Respondent's workplace.

## FINDINGS OF FACT

A preponderence of the probative evidence of record, taken in its entirety, compels the following findings of fact:

1. Respondent, E. W. Scripps Company, d/b/a The Cleveland Press, is a corporation which engages in the printing of daily newspapers and it ships and receives materials to and from points outside Ohio.

2. On or about March 7, 1975, Respondent employed approximately 1,300 persons at its place of business in Cleveland, Ohio where it manufactured goods for interstate shipment.

3. On or about March 7, 1975, one or more of Respondent's employees were exposed to noise levels in excess of those listed in Table G-16, a part of the safety and health standard promulgated by Complainant and codified at 29 CFR 1926.95; those employees wore personal protective equipment; the excessive noise levels emanated from printing presses and the folder equipment which was attached thereto and/or operated therewith.

4. Complainant has failed to prove that feasible engineering controls to reduce the noise levels described in Finding of Fact No. 3 do exist; neither the availability nor the cost to Respondent of the installation and use of any such engineering controls has been determined with any degree of certainty.

5. Complainant has failed to prove that any administrative controls to reduce the noise levels described in Finding of Fact No. 3 are possible.

## CONCLUSIONS OF LAW

1. Jurisdiction of the parties and of the subject matter herein is conferred upon the Occupational Safety and Health Review Commission by Section 10(c) of the Act.

2. At all times relevant hereto, Respondent was an employer engaged in a business affecting commerce within the meaning of Section 3(5) of the Act and as such was subject to the requirements of Section 5(a)(2) of the Act.

3. The occupational safety and health standard codified at 29 CFR 1910.95 is a standard promulgated by Complainant under the Act (as defined in Section 5(a)(2) of the Act) and that standard is not so unreasonable, arbitrary or capricious as to be constitutionally unenforceable or invalid.

4. Respondent did not violate Section 5(a)(2) of the Act by failing to comply with the provisions of the safety and health standard codified at 29 CFR 1910.95 on or about March 7, 1975; no feasible engineering or administrative controls have been shown to exist which would reduce the noise levels described by Complainant in his citation.

## ORDER

Upon consideration of the foregoing findings and conclusions, it is hereby ORDERED that

The citation issued to Respondent by Complainant's agent on March 21, 1975, be, and it is hereby, VACATED.

DECISION

Before ROWLAND, Chairman; CLEARY and COTTINE, Commissioners.

BY THE COMMISSION:

This case presents the issue whether Administrative Law Judge Henry F. Martin, Jr. correctly vacated a citation alleging that Kelly Springfield Tire Company violated section 5(a)(1) of the Occupational Safety and Health Act of 1970.[1/] Judge Martin determined that the Secretary of Labor failed to establish recognition of a hazard. For the following reasons, we reverse the judge's decision and affirm the citation.[2/]

---

1/ 29 U.S.C. §§ 651-678 ("the Act"). Section 5(a)(1), 29 U.S.C. § 654(a)(1), provides:

> Sec. 5.(a) Each employer — (1) shall furnish to each of his employees employment and a place of employment which are free from recognized hazards that are causing or are likely to cause death or serious physical harm to his employees.

2/ This case is before the Commission for review pursuant to section 12(j) of the Act, 29 U.S.C. § 661(i). Commissioner Cleary granted the Secretary's petition for discretionary review.

I

The section 5(a)(1) citation issued following an Occupational Safety and Health Administration inspection of a dust collection system in Kelly Springfield's Tyler, Texas plant. In the citation, the Secretary alleged that Kelly Springfield failed to "maintain and/or operate the #4 Ventrijet Dust Collector System in a manner to insure that its employees were protected from the hazards of an explosion."

Kelly Springfield used four Ventrijet dust collection systems to collect rubber dust generated during the production of white sidewall tires. Part of the production process involves grinding away a thin layer of rubber along the rib of the tire to reveal a white layer. The grinding is performed with a motor-driven stone on a machine called a rib buffer. The rubber dust generated in this operation is vacuumed away at the point of operation by a Ventrijet dust collection system. This type of dust collection system consists of pick-up nozzles leading into a duct which is connected to a large, box-like piece of equipment called a dust collector. A fan capable of drawing as much or more than 10,000 cubic feet of air per minute creates a vacuum in the dust collector, the duct, and the pick-up nozzles, pulling the rubber dust from the grinding operation into the dust collector. In the top of the dust collector, the rubber dust is separated from the air by a process which mixes the dust-laden air with water. The dust-laden air is drawn over nozzles, called venturi, which are partially covered with water. The movement of the air passing through these nozzles creates turbulence, which mixes the water with the dust-laden air and causes the dust particles to fall out of the air stream. The dust falls into a water tank in the bottom of the dust collector and is finally removed as sludge for disposal. The

cleaned air exhausts from the dust collector through the fan and out an opening through the roof of the plant.

On May 12, 1978, there was an explosion in dust collection system No. 4, which served rib buffers Nos. 9, 10, and 11. The explosion was preceded by two fires. The first fire occurred at the point of grinding on rib buffer No. 11. The second fire occurred in the duct between rib buffer No. 9 and the dust collector. Perhaps 15 seconds after the second fire was discovered, dust collector No. 4 exploded. The force of the explosion blew the cast iron doors off the collector and bulged out its sides. No one was injured in the explosion. However, because the dust collector was located in a work area, employees could have been injured.[3/]

Ventrijet dust collection systems are necessarily relatively airtight or enclosed because a vacuum is necessary to collect the dust. The only openings during operation are at the pick-up nozzles and at the roof of the plant. All access doors, used for maintenance, are closed during operation. Thus, there are only limited openings through which any pressure can be vented, unless explosion venting has been designed into the system. Kelly Springfield's dust collection system No. 4 did not have explosion venting. In addition, it was designed to withstand a pressure build-up of only 10 inches water gauge static pressure because these collection systems were designed only to withstand the suction pressure exerted by the fan.

---

3/ An aisle containing an uncured tire storage area passed by collector No. 4. Also, an employee break area and a janitorial storage area were adjacent to the collector.

In addition, there was a source of heat pressure in the dust collection system. Fires in this type of dust collection system have been common throughout the tire manufacturing industry and Kelly Springfield has experienced about 70 fires in about 15 years. The fires started at the point of grinding where friction heated up the rubber dust, sometimes producing embers that entered the pick-up nozzles and the duct. These embers ignited rubber dust which had adhered to the hood over the grinding stone where the pick-up nozzles were located or which had accumulated to some extent in the duct. Some dust always fell out of the air stream and there was more dust under the hood or in the duct if, for any reason, the suction of the fan was reduced.

Mr. Tarr, a consulting chemical engineer specializing in air pollution abatement systems, testified for the Secretary that chemical engineers recognize as a general principle that an explosion is possible if a combustible dust and oxygen are combined in an enclosed space and there is a source of ignition. He stated that the chances of an explosion depend on various factors, such as the rate of combustion, the availability of oxygen to sustain combustion, the size of the space, and its capacity to vent heat energy safely or contain the build-up of heat energy. According to Mr. Tarr, chemical engineers realize that they must design any enclosed system to contain or safely vent explosions whenever a combustible dust, oxygen and an ignition source are present.

Mr. Tarr acknowledged that he was unfamiliar with the tire manufacturing industry's specific awareness of this hazard but he asserted that recognition of the general principle underlying this explosion hazard is not confined to any one industry. Having examined Kelly Springfield's dust collection system, he concluded that it was hazardous. He pointed

to the recurring problem of fires in the enclosed system and the amount of dust in the ducts. He also cited the lack of explosion venting.

Kelly Springfield countered with evidence that the tire manufacturing industry, in which the use of dust collection systems like Kelly Springfield's is common, is not aware of any explosion hazard presented by these systems. Mr. Woodling, a mechanical engineering section head for Goodyear (of which Kelly Springfield is a subsidiary); Mr. Borgerding, Kelly Springfield's plant manager; Mr. Barger, Kelly Springfield's manager of engineering; and Mr. Rutledge, a regional sales manager with Carborundum Company, which manufactures this type of dust collection system, all testified that they were unaware of any other explosion having ever occurred in this type of dust collection system and, to the best of their knowledge gained through associations with other persons connected with tire manufacturing, the tire manufacturing industry does not recognize an explosion hazard from these dust collection systems. However, Mr. Rutledge only recently learned of the recurring problems the industry and Kelly Springfield had been having with fires in the systems and he testified that, where there has been a history of fires, an expert on fires should be consulted. He further testified that he would recommend using explosion panels or vents.

These four witnesses also testified that the risk of an explosion depends on the size of the enclosed space, the amount of ventilation of the space, the amount and combustibility of the fuel, and whether a hot ember could enter the system when fuel (dust) had accumulated substantially through reduced ventilation. For example, Mr. Borgerding agreed that fire in an enclosed space could create enough pressure to explode

the enclosure but he emphasized that the possibility was only "a hypothetical." Mr. Barger posited that, as long as the fan is running, any fire would be adequately vented and there would not be any excessive, explosive pressure build-up. He also testified that his experience suggested rubber dust has a low combustion rate. Further, he believed that, if for any reason the air flow was reduced, a hot ember could never enter the duct in the first place. Mr. Woodling testified that the system was sufficiently vented at the pick-up nozzles and roof ends to prevent any excessive pressure build-up. Mr. Rutledge stated that these dust collection systems have been considered fire safe because the combustible particulate is mixed with water. In short, all testified that their experience led them to conclude there was no explosion hazard.

II

Judge Martin determined that the explosion hazard was not recognized because there was no showing "that the tire manufacturing industry has been made aware of an explosion hazard in connection with the operation of the rib buffers and ventrijet dust collectors." He based this determination on Kelly Springfield's evidence that the tire manufacturing industry is unaware of any explosion hazard presented by these dust collection systems. Judge Martin noted that, although "[a]dmittedly fires can trigger an explosion in an enclosed space given the right amount of oxygen and fuel," recognition was not established because the actual chances of an explosion vary depending on the coincidence of various conditions. Kelly Springfield's witnesses all believed that the dust collection system as maintained and operated by Kelly Springfield was capable of preventing a dangerous possi-

bility of explosion from arising. The judge found that, although the record shows fires can trigger explosions in the right circumstances, Kelly extinguished fires rapidly and maintained the dust collection system adequately as far as preventing explosions was concerned. Accordingly, Judge Martin determined that both Kelly Springfield and the tire manufacturing industry lacked knowledge of any hazard. Therefore, he vacated the citation.

The Secretary argues on review that Judge Martin erred in view of the testimony of Mr. Tarr and Mr. Rutledge. The Secretary contends that their testimony shows the hazard of pressure build-up explosions was generally recognized and was recognized by safety experts familiar with the equipment used by the tire manufacturing industry. In the Secretary's view, Mr. Rutledge's testimony shows he would take the explosion hazard into account if there is a history of fires and that he would prescribe precautions. Mr. Tarr's testimony shows that recognition of the hazard of pressure build-up explosions in enclosed spaces from the presence of a combustible fuel, oxygen, and an ignition source is not confined to any one industry but rather is based on a knowledge of one of the basic chemical engineering principles. Mr. Tarr's testimony also shows that this principle applies to Kelly Springfield's dust collection system.

Kelly Springfield argues on review that Mr. Tarr's testimony shows only recognition of a theoretical possibility of explosions. Mr. Tarr had no experience specifically with the dust collection systems used in the tire manufacturing industry to collect rubber dust from rib buffing. Therefore, in Kelly Springfield's view, the judge properly discounted Mr. Tarr's views on the hazardousness of Kelly Springfield's dust collection system. Kelly Springfield argues that the record shows the tire manufac-

turing industry does not recognize any hazard of explosions associated with this type of dust collection system.

III

To establish a section 5(a)(1) violation, the Secretary must show that an employer failed to render its workplace free from a hazard that is recognized and likely to cause death or serious physical harm to its employees. Little Beaver Creek Ranches, Inc., 82 OSAHRC , 10 BNA OSHC 1806, 1982 CCH OSHD ¶ 26,125 (No. 77-2096, 1982). The Secretary must also show that there was a feasible means available to abate the hazard. Id.; National Realty and Construction Co. v. OSHRC, 489 F.2d 1257, 1268 (D.C. Cir. 1973).

The Commission has held that it is the hazard, not the specific incident that resulted in injury or, as in this case, that might have resulted in injury that is the relevant consideration in determining the existence of a recognized hazard. See Kansas City Power & Light Co., 82 OSAHRC , 10 BNA OSHC 1417, 1982 CCH OSHD ¶ 25,957 (No. 76-5255, 1982). More specifically, a recognized hazard is a condition or practice in the workplace that is known to be hazardous by either the industry in general or the employer in particular. Kansas City Power & Light Co., supra; Continental Oil Co. v. OSHRC, 630 F.2d 446, 448 (6th Cir. 1980), cert. denied, 101 S.Ct. 1481 (March 2, 1981); Empire Detroit Steel Division, Detroit Steel Corp. v. OSHRC, 579 F.2d 378, 383 (6th Cir. 1978).

The hazard on which the Secretary focused was pressure build-up explosions from the combination of a combustible dust, oxygen, and an ignition source in an enclosed space. Mr. Tarr's testimony shows that chemical engineers take precautions against explosions if a combustible dust, oxygen, and an ignition source are present in an enclosed space and if

it is at all uncertain whether or not an explosion could occur. Moreover, Mr. Tarr's testimony shows that recognition of this general principle on the causes of explosions is not confined to any one industry. Instead, the principle is a basic one known to all chemical engineers. Consistent with this testimony showing general recognition, Mr. Rutledge's testimony shows that the industry involved in the distribution and operation of dust collection systems such as that used by Kelly Springfield believed precautions against explosions should be carefully considered if there have been fires. This evidence is sufficient to establish recognition. It shows that safety experts familiar with the general workplace condition or practice recognize it as hazardous. See National Realty and Construction Co. v. OSHRC, 489 F.2d at 1265 n. 32.[4/] Accordingly, we find that the hazard of pressure build-up explosions from oxygen, a combustible dust, and an ignition source in an enclosed space was recognized.

The evidence on which Judge Martin relied to make a contrary finding shows only that the experience of the tire manufacturing industry with this type of dust collection system had been thus far free of explosions. It does not show, however, that the hazard of such explosions was not recognized by safety experts familiar with the causes of explosions and the type of dust collection system used by the tire manufacturing industry to collect rubber dust. Since the Secretary's evidence establishes this recognition, we set aside the judge's contrary finding.

---

4/ Because Mr. Tarr was familiar with the type of dust collection system, ventrijet or low energy wet scrubber systems, applied to the collection of rubber dust in Kelly Springfield's plant, his lack of experience in the tire manufacturing industry does not detract from the weight we afford his testimony.

IV

Because Judge Martin determined that the Secretary failed to establish the recognition element of a section 5(a)(1) violation, the judge vacated the citation and did not enter factual findings and legal conclusions on the remaining section 5(a)(1) elements. However, the record in this case is complete and we have the authority to make factual findings. Franklin R. Lacy, 81 OSAHRC 7/A2, 9 BNA OSHC 1253, 1981 CCH OSHD ¶ 25,170 (No. 3701, 1981), citing Accu-Namics, Inc. v. OSHRC, 515 F.2d 828, 834 (5th Cir. 1975), cert. denied, 425 U.S. 903 (1976). Accordingly, in the interest of efficient adjudication, we will make the necessary determinations on the remaining elements of a section 5(a)(1) violation.

Mr. Tarr's testimony indicates that the workplace was not free of the hazard. The dust collection system was not operated or maintained in such a way as to protect employees from the danger of an explosion caused by the combination of oxygen, a combustible dust, and an ignition source in the enclosed space, nor were any other means used to free the workplace of the hazard.

Also, the record establishes that an explosion would be likely to cause death or serious physical harm to employees. Material and equipment storage areas and an employee break area were located near the dust collector. Thus, employees were subject to serious injury or death in the event of an explosion.

The remaining question is whether the Secretary established a feasible means of reducing or eliminating the hazard. The record shows that the amount of dust accumulating in the ducts can be controlled by

assuring that the vacuum in the dust collection system is maintained. This involves assuring that the water level is maintained at the proper level. If the water level becomes too high, the suction of the fan through the top of the collector to the ducts and rib buffers is reduced and more dust accumulates in the system. A hot ember or spark can ignite the accumulated dust, particularly under the hood at the grinding stone or in the duct leading away from the point of grinding. The same thing can happen if the water level becomes too low. At first, because the air flow is less impeded by the water level, the vacuum is increased. However, if the water goes below a baffle in the water tank which separates the sludge removal area from the water, then air can come into the upper part of the collector through the sludge removal opening. When this happens, the fan draws principally from the sludge removal opening, since it is closer to the fan than the remote vacuum nozzle openings at the rib buffers. In that event, the suction is reduced at the rib buffers, combustible rubber dust accumulates in the ducts, and fires occur.

Kelly Springfield had tried two methods of controlling the water level but had problems with both methods. One method was an overflow system. The required water level was maintained by running more water into the collector than was needed and draining off the excess at the required level into an overflow pipe. The other method employed a "solenoid valve" to maintain the correct water level. This system consisted of an electronic probe placed in the standing water level control box. When the probe indicated water was needed, a water valve was electronically opened. Kelly Springfield had problems with the overflow pipe stopping up. Therefore, Kelly Springfield had abandoned this

method and resorted to the probe system. However, Kelly Springfield had various electrical and mechanical problems with the probe system, too.

The record shows that the water level can be controlled. According to Kelly Springfield's plant manager, Mr. Borgerding, a new control method — a bounced-air system — worked well at other Kelly Springfield plants. This water control method was installed in the Tyler, Texas plant after the inspection.

The preponderance of the evidence of record also shows that the accumulations of dust in the ducts and portions of the dust collector can be substantially reduced by adhering to the manufacturer's recommendation to clean out the accumulations once a week. Before the inspection, Kelly Springfield had not been adhering to this requirement. Accordingly, we find that there were feasible measures to reduce the hazard.[5/]

Because all of the section 5(a)(1) elements have been established, we reverse the judge's decision and affirm the citation. We therefore must consider the penalty to be assessed. Because employees worked in the vicinity of the dust collectors, fires frequently occurred, and the harm that could result from an explosion could be severe, we consider

---

5/ Measures are feasible if they materially reduce the hazard; it is not necessary for the Secretary to show that the hazard can be eliminated. Litton Systems, Inc., Ingalls Shipbuilding Div., 81 OSAHRC 101/C12, 10 BNA OSHC 1179, 1981 CCH OSHD ¶ 25,817 (No. 76-900, 1981), and cases cited therein.

The Secretary also suggested altering the grinding process to reduce sparking, installing explosion venting in the dust collectors, or removing the dust collectors from areas which employees frequent. While we do not rule on the feasibility of any of these measures, we note that Kelly Springfield must free its workplace of the hazard by any feasible means. Accordingly, Kelly Springfield must determine whether these additional means to reduce the hazard are also feasible.

the gravity of this violation to be high. Kelly Springfield is not a small employer and, although the company did take some steps to control fires in the dust collection systems, Kelly Springfield's efforts were incomplete and relatively simple measures remained to be taken. In view of this, we conclude that $810, the penalty proposed by the Secretary, is appropriate.

Accordingly, the decision of the judge vacating the citation is reversed. The citation alleging a violation of section 5(a)(1) is affirmed. A penalty of $810 is assessed. SO ORDERED.

FOR THE COMMISSION

Ray H. Darling, Jr.

RAY H. DARLING, JR.
EXECUTIVE SECRETARY

DATED: AUG 27 1982

Kelly Springfield
No. 78-4555

ROWLAND, Chairman, dissenting:

I respectfully dissent. I agree with Judge Martin's determination that, on the basis of the evidence in this case, the Secretary of Labor did not establish recognition of the hazard. In my view, the majority incorrectly evaluates the substance and weight of the Secretary's evidence. Accordingly, I would affirm the judge's decision vacating the citation.

To establish the alleged section 5(a)(1) violation in this case, the Secretary must prove that the hazard of pressure build-up explosions from fires of accumulated rubber dust in a dust collection system such as the one used by Kelly Springfield was recognized, either by the tire manufacturing industry or by Kelly Springfield. See e.g., Cargill Inc., Nutrena Feed Division, 82 OSAHRC , 10 BNA OSHC 1398, 1399, 1982 CCH OSHD ¶ 25,935 at p. 32,484 (No. 78-5707, 1982). Judge Martin found that Kelly Springfield was not aware of the hazard and, although the Secretary argues otherwise on review, the majority in their decision does not overturn these findings.[6/] Instead, the majority finds

---

6/ In my view, the judge correctly concluded that the Secretary did not prove that Kelly Springfield actually knew of the hazard. Two employees, Mr. Berryman and Mr. Pierce, asserted that they had observed damage caused by a prior explosion. However, they did not report to anyone that any explosion had occurred, and Mr. Barger, the manager of Kelly Springfield's engineering department, explained that the damage the employees had observed was caused by a malfunctioning fan, not an explosion. The judge implicitly credited the testimony of Mr. Barger and his implicit credibility determination is supported by the record. See e.g., Kus-tum Builders, Inc., 81 OSAHRC , 10 BNA OSHC 1128, 1130 n. 3, 1981 CCH OSHD ¶ 25,738 at p. 32,106 n. 3 (No. 76-2644, 1981) (judge's determinations concerning credibility and weight should not be disturbed on review when they are supported by the record). Accepting the judge's implicit credibility evaluation, I conclude that the judge correctly determined that the Secretary's evidence was insufficient to show actual recognition by Kelly Springfield.

that the tire manufacturing industry was aware of the hazard, relying on opinion testimony from a chemical engineer unfamiliar with the tire manufacturing industry and a regional sales manager of a company which sells dust collection systems to the tire manufacturing industry. The majority characterizes these witnesses as "safety experts familiar with the general workplace condition or practice," but discounts the opposing testimony from Kelly Springfield's plant manager, Kelly Springfield's engineering manager, and a Goodyear engineering manager, despite their superior knowledge and experience in the industry with dust collection systems such as Kelly Springfield's. Thus, the majority in this case ignores the fundamental principle that the weight to be accorded opinion testimony depends on, among other things, the witness's knowledge and experience of the subject matter and the reasoning with which his opinion is supported. See Kaiser Aluminum and Chemical Corp., OSHRC Docket No. 77-699 (July 30, 1982) (dissenting opinion) (expert testimony); Air-Kare Corp., 81 OSAHRC 98/A2, 10 BNA OSHC 1146, 1151-52, 1981 CCH OSHD ¶ 25,758 at pp. 32,179-80 (No. 77-1133, 1981) (dissenting opinion) (lay opinion testimony).

The Secretary presented the chemical engineer, Mr. Tarr, as an expert in his field, and Judge Martin permitted him to testify about recognition of an explosion hazard in this case provided that the Secretary elicited supporting knowledge and experience for the witness's expert opinions. Mr. Tarr was an engineering consultant specializing in designing air pollution abatement systems. Prior to becoming a consultant, Mr. Tarr was employed by the Texas Air Control Board where, among other things, he evaluated the toxic effects of chemical

carcinogens, the extent to which existing facilities complied with the Board's air pollution regulations, and special or unusual problems of air pollution. In connection with the assignment to special air pollution problems, Mr. Tarr investigated one explosion. However, the explosion resulted from the rupture of an ammonia pipeline between two plants in Texas and, from Mr. Tarr's description of the circumstances, it is apparent that this explosion did not involve processes or equipment in any way similar to this case. Mr. Tarr was familiar with various low-energy water scrubbers or dust collection systems, of which Kelly Springfield's is an example, but he frankly stated that "there are all different kinds of low-energy water scrubbers" and that he had "never seen one exactly like this particular one before." Mr. Tarr's visit to Kelly Springfield's Tyler, Texas plant for the Secretary in this case was the first time Mr. Tarr had any professional contact with the tire manufacturing industry. Accordingly, Mr. Tarr's opinons about the hazardous nature of Kelly Springfield's dust collection system and industry recognition of the hazard cannot be accorded much weight, for the witness was completely unable to describe any specific knowledge or experience qualifying him to give such opinions.

Not surprisingly, in view of this complete lack of specific knowledge and experience, Mr. Tarr was only able to testify about a general, textbook chemical engneering principle. Indeed, the majority acknowledges as much in saying that his testimony concerned only a "general principle on the causes of explosions." Moreover, Mr. Tarr recognized that whether an explosion occurs depends on more complex factors than the general principle he described takes into account, such as combustion rate, oxygen availability, ventilation capacity, and size of the

enclosed space. The witness thought that Kelly Springfield's dust collection system was hazardous, but only on the basis of his one-time, brief examination of it prior to testifying and only because there were recurring fires and dust accumulations in an unvented enclosed space. Obviously, Mr. Tarr was simply relying on the general principle which he had conceded did not take into account critical factors bearing on the actual existence of a hazard. Because Mr. Tarr was not familiar with the tire manufacturing industry or the dust collection system at Kelly Springfield's plant, and because Mr. Tarr's opinion about recognition of the hazard was founded only on a "general principle" on explosions, I conclude that Mr. Tarr's testimony is entitled to little weight.

The sales manager's testimony is no more reliable. This witness, Mr. Rutledge, sold dust collection systems to the tire manufacturing industry. Accordingly, he had had contact with the tire manufacturing industry for the purpose of satisfying its need for an efficient and affordable dust removal technology. Mr. Rutledge believed that, in this connection, he would have learned of any industry problems with explosions. However, as he conceded, the complaints from customers concerned mostly wear and tear and, although there had been a general problem with fires throughout the industry for a considerable time, he had only first learned of the fire problem lately, during this case. Thus, Mr. Rutledge had little real basis for giving any opinion about the industry's awareness of an explosion hazard from the dust collection systems it used. Moreover, Mr. Rutledge conceded that he was not an expert in fires and explosions, and that any en-

gineering problem with the dust collection systems would be handled by the engineering department of his company. He said that he simply described the problems to the engineers. Thus, Mr. Rutledge admitted that he did not have either the training or the experience to make recommendations about safety hazards or their abatement. Thus, the suggestion he gave in this case, on which the majority relies, about precautions against explosions can only be considered speculative. It is entitled to little weight as an indication of general recognition of an explosion hazard from recurring fires. See H.E. Wiese, Inc., 82 OSAHRC , 10 BNA OSHC 1499, 1510-11, 1982 CCH OSHD ¶ 25,985 at pp. 32,618-19 (No. 78-204, 1982) (dissenting opinion) (lay opinion not based on personal knowledge is not entitled to controlling weight), citing Ray Evers Welding Co. v. OSHRC, 625 F.2d 726, 733 (6th Cir. 1980). Moreover, in giving the testimony on which the majority relies, Mr. Rutledge was merely answering the Secretary's hypothetical cross-examination. He was asked, "If you have a circumstance where there [is] a history of fires inside a water scrubber and a known problem with low water levels, would you recommend the use of explosion panels or venting?" To this, Mr. Rutledge replied "yes" but he emphasized that, since he and his company are not experts in fire control, they would recommend consulting an expert in fire control "rather than become directly involved."

In contrast to the weak testimony on which the majority relies, there is the evidence of Mr. Borgerding, Kelly Springfield's plant manager, Mr. Barger, Kelly Springfield's engineering manager, and Mr. Woodling, Goodyear's engineering manager. Mr. Borgerding had 31 years

of experience in the tire manufacturing industry and, as a mechanical engineer, was a member of various professional industry associations. Mr. Borgerding testified that he never heard of an explosion and that the industry does not consider its rubber dust collection systems as presenting a hazard of explosions. Mr. Barger had 33 years of experience in the tire manufacturing industry and was familiar with dust collectors at other plants. He, too, had never heard of any explosions in the dust collection systems. Mr. Woodling was a mechanical engineer and a Goodyear section chief of engineering. He was a member of the Society of Mechanical Engineers in Akron, the center of the tire manufacturing industry where several plants of major tire companies are located. Mr. Woodling was completely familiar with dust collection systems of the type used by Kelly Springfield, and testified that their use is typical of the industry and that he never heard of an explosion hazard associated with them.

In light of the extensive experience of these three witnesses, I conclude that their testimony is dispositive. Contrary to what the majority says, their testimony does show that "the hazard of . . . explosions was not recognized by safety experts familiar with the causes of explosions and the type of dust collection system used by the tire manufacturing industry to collect rubber dust." Therefore, I agree with the judge's determination that the Secretary did not establish industry recognition of the hazard. Because the Secretary has not established a critical element of his charge, I would affirm the judge's decision vacating the section 5(a)(1) citation.

UNITED STATES OF AMERICA

OCCUPATIONAL SAFETY AND HEALTH REVIEW COMMISSION

| SECRETARY OF LABOR,<br><br>Complainant,<br><br>v.<br><br>KELLY SPRINGFIELD TIRE COMPANY<br><br>Respondent. | OSHRC DOCKET NO. 78-4555 |

APPEARANCES: Tracy Crawford, Esquire
Tyler, Texas
For the Respondent

Marigny A. Lanier, Esquire
Dallas, Texas
For the Complainant

DECISION AND ORDER

MARTIN, Judge:

This is a proceeding brought pursuant to Section 10(c) of the Occupational Safety and Health Act of 1970 (29 U.S.C. 651 et seq.) hereinafter referred to as the Act. Respondent filed a timely notice of contest to a citation issued on September 20, 1978, wherein respondent was charged with violating Section 5(a)(1) of the Act, commonly referred to as the general duty clause.[1/] A penalty of $810 was proposed by complainant.

---

1/ Section 5(a)(1) of the Act provides as follows:

> "Each employer shall furnish to each of his employees employment and a place of employment which are free from recognized hazards that are causing or are likely to cause death or serious physical harm to his employees."

On May 12, 1978 an explosion took place in a dust collector at respondent's tire manufacturing plant in Tyler, Texas. Between May 12 and 15, 1978, representatives of the complainant conducted an inspection of respondent's plant which resulted in the issuance of the aforementioned citation. After several amendments, respondent was charged with failing to have a place of employment free from a recognized hazard that was causing or likely to cause death or serious physical harm to its employees in that:

> On or about May 12, 1978, at approximately 8:30 AM, the employer did not maintain and/or operate the number 4 Ventrijet dust collector system in a manner to insure that its employees were protected from the hazards of an explosion.

Following the filing of the notice of contest a complaint was filed by complainant and respondent, through its counsel, filed an answer generally denying the allegations of the complaint.[2/] Pursuant to notice, a formal hearing was held in Dallas, Texas on May 30th and 31st, 1979. Following the hearing briefs were filed by both parties.

In May 1978, respondent, Kelly Springfield Tire Co., was operating its tire manufacturing plant in Tyler on a 24 hour a day basis (three working shifts) with approximately 1500 employees. On May 12th shortly after 8:00 AM the number 4 Ventrijet dust collector exploded, blowing off the access doors and distorting the side walls of the dust collector located

---

2/ The complaint did not describe the alleged violation - - instead the citation dated September 20, 1978 was incorporated by reference.

adjacent to an aisleway which is used as a walkway by employees (see photographs identified as complainant's exhibits 7-U, 7-V, and 7-W). Fortunately no employees were in the immediate vicinity of the dust collector at the time of the explosion. Just prior to the explosion a fire alarm sounded because of a fire in the duct leading from the number 11 rib buffer (see complainant's exhibit 7-B).

In the Tyler plant there are four Ventrijet dust collectors. The number 4 dust collector collects rubber dust or particles which have been ground off the tires in order to produce "white walls". This particular collector collects the rubber particles being ground off of the tires by the number 9, 10, and 11 rib buffers. The ducts from the three rib buffers lead into a main duct which goes to the collector, located some 60 feet away. The rubber dust (a typical sample of the rubber particles is contained in respondent's exhibit R-1) is sucked from the rib buffers by an air current created by an exhaust fan at the top of the dust collector. The purpose of the collector is to separate the dust from the air. The rubber dust falls into a water tank and the air is vented out through the roof. The rubber dust is warm and sticky when it is ground off of the tires and it frequently catches fire in the ducts because of the heat and friction from the grinding stone. A review of complainant's exhibit C-5 shows that 67 fires have been reported in the ducts leading to the number 2 and number 4 dust collectors between November, 1964 and October, 1976. These fire reports reveal no evidence of an explosion in either dust collector.

The dust collection system has been referred to as a confined or enclosed air space however there are openings at the rib buffer stations and at the top of the dust collector where the air is expelled through a vent in the roof.

The Ventrijet dust collector has been described as a low energy wet scrubber. In the collector there are two compartments (a clean air side and a dust side) divided by a partition called a water baffle. Operating water rises above the venturi tubes. Suction from the fan creates turbulence in the water on the dust side as it draws water through the venturi tubes. The rubber dust is stripped from the air stream and falls to the bottom of the collector. The clean air is then expelled by the exhaust fan through a vent pipe to the roof.

The water level in the collector should remain at a constant level in order to function efficiently. The evidence indicates that respondent has had some difficulties with the water control mechanism. When the water level is too low or too high the suction or movement of air through the ducts may be affected. On May 12th one of respondent's maintenance men, Mr. Berryman, was directed to check on the water level and found that it was below the water baffle. Apparently the automatic water control valve was not functioning properly so he opened a manual water valve. In order to visually check the water level he proceeded to open an access door. Shortly after closing the access door he heard the fire alarm go off at the number 9 rib buffer. After he walked away the dust collector exploded.

Following the explosion respondent's fire chief, Mr. Arnold, listed as the probable cause "low water level" in the number 4 dust collector. At 7:43 AM a fire in the number 11 rib buffer duct was extinguished. At around 8:05 AM and about the time of the explosion a fire was noticed in the number 9 rib buffer duct. Chief Arnold felt that the low water level caused a loss of vacuum on the number 9, 10, and 11 rib buffers and that gases accumulated in the dust collector when it was opened to check on the low water level and that there was still fire in the duct from the number 9 rib buffer which was drawn into the dust collector causing a spontaneous combustion (complainant's exhibit C-6).

The issue to be determined is whether the respondent failed to maintain its dust collecting system in a manner so as to protect its employeees from a recognized hazard, to wit, an explosion in its number 4 Ventrijet dust collecting system. Complainant contends that respondent was aware of the hazard of an explosion because it knew of the existence of many fires in the ducts leading from the rib buffers to the dust collectors and took no measures to remove the source of the fires and because any fire in an enclosed space has the potential for an explosion. Respondent's position is that the fires in the collecting ducts are a common problem in the operation of rib buffers; that the tire manufacturing industry does not have any knowledge of a potential explosion hazard regarding the operation of this type of dust collecting system being used in conjunction with rib buffers; and further that respondent itself had no knowledge of an explosion hazard being present in its rib buffing and dust collecting system.

In order to establish a violation of Section 5(a)(1) of the Act, the complainant is required to prove (1) that the employer failed to render its workplace "free" of a hazard which was (2) recognized, and (3) causing or likely to cause death or serious physical harm to its employees.

The testimony of all witnesses appearing in this case and the exhibits introduced by the parties support a finding that respondent's dust collecting system has been plagued with fires in the ducts leading from the rib buffers and the main ducts to the dust collectors and an occasional fire in the collector itself. Some 67 fires were made a matter of record (see complainant's exhibit C-5) between November, 1964 and October, 1976 nearly all of which were in the number 2 collecting system. Only 6 of the fires were reported in the number 4 collecting system, ranging from April, 1975 through September, 1976.[3/] No mention was made of any explosion, however, the reports generally blamed the fires on rubber dust build up in the ducts, coupled with the heat and friction generated by the rib grinders or buffers.

Mr. James N. Tarr, a chemical engineer, called by complainant testified that he had examined the dust collecting system at respondent's Tyler plant, which he stated is similar to other water scrubber systems in general use. Because of the number of fires in respondent's plant between the dates of 1964 and 1976, Mr. Tarr felt that fires in an enclosed system are hazardous

---

3/ The four ventrijet dust collectors in respondent's plant were all manufactured by the Pangborn Corporation and are used by other tire manufacturers. The Pangborn Corporation was acquired several years ago by the Carborundum Company.

and that a potential for an explosion exists. He testified that an accumulation of rubber particles in the ducts are sufficient to cause an explosion when the right proportion of oxygen is present and an ignition source is introduced within the enclosed space. He advised that it is common knowledge that where there is fuel, an ignition source and oxygen in an enclosed area an explosion is possible.

Mr. Rutledge, an engineer and regional sales manager for the Carborundum Company, the present manufacturer of the ventrijet collector, testified that wet scrubber devices such as those manufactured by his employer are considered a fire safe device in that the dust particles collected are mixed with water streams. Until recently he had not heard of any complaints as to fires or explosions in the dust collecting system. He was not familiar with the rate of combustion of rubber materials but stated that he would be concerned if there was a history of repeated fires and low water levels (Tr. 261). Prior to the hearing Mr. Rutledge inspected the dust collecting system of respondent and found it to be functioning properly. He was made aware of the fire reports prepared by the fire chief but stated that he did not believe it was of great concern since a wet scrubbing device is an effective fire extinguisher.

Mr. James C. Woodling, head of respondent's mechanical section in the corporate engineering department, testified that fires are common in the rib buffing phase of the tire manufacturing industry and appeared to be more frequent in the case of radial tires. While he would not anticipate fires occurring he stated that they are a continuing problem and that

"we try to deal with it on a day to day basis", trying to reduce the possibility of fires. He expressed no knowledge of explosions in connection with the dust collecting system, with the exception of the Tyler explosion. He advised that the failure to properly maintain the system could have some relevancy toward an explosion potential. (Tr. 282-287). He was unable to account for the explosion which occurred on May 12th and while describing the dust collecting system as an enclosed one, pointed out the several different openings in the system and the fact that the air removal capacity (14,000 cubic feet per minute) is actually oversized and any explosive gasses should be diluted.

Mr. William Barger, manager of respondent's mechanical engineering department in Tyler, testified that he had no reason to believe that an explosion potential was present on or about May 12th. He stated that he was never advised or made aware of any prior explosion in a ventrijet dust collector, although he admitted that fires do occur in the duct work leading from the rib buffers. He did recall an occasion when a fan disintegrated, damaging the building, overhead steel work and distorting pipes (Tr. 213). He attributed it to an over-speeding condition.

Mr. Barger testified that he had undertaken several studies as to the cause of the fires in the rib buffing operation and had re-designed the duct work in 1975 (Tr. 329). He was not aware of any fires after 1976 with the exception of the May 12th fires and explosion.

Mr. James Borgerding, respondent's plant manager who was present on the day of the explosion, testified as to the way the rib buffers grind the

tires to turn out "white walls". The major problem relates to the operators grinding the tires at an excessive rate causing heat, friction and occasionally sparks. He was not aware of fires in the dust collector itself but admitted that it might be possible. He recalled that an investigation was made following the explosion but that the exact cause could not be determined. He stated that a water level control failed to function properly and that it might have affected the efficiency of the system. He advised that he was not aware of any explosion hazard associated with the dust collector.

Mr. Ray Jackson, a staff mechanical engineer, testified that on the day of the explosion he was informed that the water level in the number 4 dust collector was low. He was not personally aware of any previous fires in the dust collector but stated that he had heard that it may have happened. He stated that he was formerly a member of the Safety Committee and that no report had ever been made regarding any explosion in the number 2 dust collector in 1975.

Mr. Leroy Berryman, maintenance technician, testified that Mr. Jackson instructed him to check on the water level just before the explosion and that he found it to be low. He indicated that the company had had considerable trouble with water control valves and solenoid failures. Mr. Berryman has observed fires in the ducts, which were caused by the rib buffing operators. He stated that rubber dust or particles would build up in the ducts and that they were not always cleaned out every week. Although not aware of the specific date (1975) he recalled what he thought had been an

explosion (he was not on duty at the time) in the number 2 dust collector when the doors were distorted and the fan came apart. He stated that although the water level was low in the dust collector on various occasions and maintenance was not always done according to the manufacturer's recommendations, he personally checked the water levels everyday on his shift. (Tr. 158, 160). He testified that before the explosion the ducts had as much as 4 to 6 inches of rubber dust but that no problems were encountered. He admitted that some specifications were not always accomplished on a weekly basis. He was unable to state whether any of the lax maintenance items had any bearing upon the explosion.

Mr. James L. Pierce, a maintenance electrician, testified regarding problems with an automatic water control, a solenoid valve and a probe. Although Mr. Pierce was not present when the alleged explosion took place in the number 2 dust collector in August of 1975, he was there on the following day and discovered that the fan had disintegrated, the doors on the dust collector were distorted and the dome had bulged out. He stated that it had the appearance of an explosion because of the distorted doors and bent angle iron supports. Although he stated that the doors were "blown off the hinges" he later testified that he did not mean to say that. He advised that the metal doors were straightened out by Mr. Berryman.

After carefully considering the entire record it is concluded that complainant has not established by a preponderance of the reliable and probative evidence that respondent failed to render its workplace free of

a recognized hazard which was causing or likely to cause death or serious physical harm to its employees on or about May 12, 1978. No evidence has been presented to show that the tire manufacturing industry has been made aware of an explosion hazard in connection with the operation of the rib buffers and the ventrijet dust collectors. In order to prove a serious violation under the Act it must be shown that there is a substantial probability that death or serious physical harm would result from the operation or process in question unless the employer did not or could not with the exercise of reasonable diligence know of the presence of the hazard.[4/]

In order to show knowledge of an explosion hazard on the part of respondent the testimony of Mr. Berryman and Mr. Pierce was presented as to an alleged explosion in the number 2 dust collector three years earlier. Neither of them actually observed any explosion and there is no indication that respondent's officials were ever made aware of any explosion in a dust collector prior to the May 12th explosion. Both of the employees admitted that metal can warp and become distorted in a fire. A review of

---

4/ Section 17(k) of the Act provides as follows:

> For purposes of this section, a serious violation shall be deemed to exist in a place of employment if there is a substantial probability that death or serious physical harm could result from a condition which exists, or from one or more practices, means, methods, operations, or processes which have been adoped or are in use, in such place of employment unless the employer did not, and could not with the exercise of reasonable diligence, know of the presence of the violation.

complainant's exhibit C-5 fails to reveal an explosion report in connection with dust collector number 2 during 1975 or at any other time.

Another matter to be considered is the effect of the long history of fires in the dust collecting system and whether the occurence of fires associated with the rib buffing process put respondent on notice that the dust collector itself was likely to explode. Admittedly fires can trigger an explosion in an enclosed air space given the right amount of oxygen and fuel. The rubber dust or particles can become combustible. The matter of fires in the ducts leading from the rib buffers have been for some time a continuing problem for respondent's fire brigade who have been able to extinguish the blazes, usually within a few minutes.

Complainant has stressed the recurring problem which respondent has had with the water level control and its failure to make certain weekly checks on various maintenance items. Mr. Berryman, however, testified that he checked the water levels daily on his shift. While fires in the ducts can have serious consequences the citation issued on September 20, 1978 does not relate to fire hazards - - only explosion hazards. Of course, as complainant contends a fire in the duct might become an ignition source for an explosion. It should be pointed out however, that the fires were never as frequent in the number 4 dust collecting system as they have been in the number 2 collecting system. As a matter of fact for a period of some 18 months prior to the May 12th explosion <u>no fires were reported in the rib buffing ducts, the main duct, or the dust collector itself</u>. (Underlining supplied). Although respondent was perhaps lax in complying with

certain maintenance procedures it apparently did not result in any fires during the 18 months preceeding the explosion. There is no evidence to show the respondent's management officials were aware that its maintenance personnel failed to make weekly checks as recommended by the manufacturer or that the number 4 ventrijet dust collector was operated in such a manner as to present an explosion hazard to its employees.[5/] Although problems with the water control valve and accumulations of rubber dust were maintenance items stressed by complainant as contributing to the fires in the Tyler plant, the fire reports maintained by respondent revealed that the dust collecting system has been free of fires for 18 months prior to the explosion.

Based upon the record as a whole it is concluded that respondent did not knowingly subject its employees to an explosion hazard on May 12, 1978.

---

5/ At this point it should be noted that complainant's enforcement officials were vacillating for several months after the May 12th explosion as to what recognized hazard to cite. On June 9th the first citation was issued and it was apparently intended to cover the "waterfront". It charged respondent with failing to protect its workers from fire and explosions by locating the dust collector "out of doors or in a detached room, or specifically engineered for indoor installation, or provide the collector with explosion venting to the outside". The last alternative was "by any other means/methods to protect its employees." (Underlining supplied). The June 20th citation amended the previous citation with the comment, "deleted pending further investigation". On August 30th the third citation was issued and alleged that the recognized hazard was respondent's failure to maintain, repair or remove the dust collector from service which was known to be operating with a defective automatic water control valve.

Accordingly it is ORDERED that the citation be and the same is hereby vacated along with the proposed penalty.

So ORDERED at Dallas, Texas this 17th day of March 1980.

## DECISION

Before ROWLAND, Chairman; CLEARY and COTTINE, Commissioners.

BY THE COMMISSION:

A decision of Judge Vernon Riehl is before the Commission pursuant to section 12(j), 29 U.S.C. § 661(i), of the Occupational Safety and Health Act of 1970, 29 U.S.C. §§ 651-678 ("the Act"). Judge Riehl found that General Motors Corporation, Central Foundry Division ("General Motors") had violated section 5(a)(1) of the Act, 29 U.S.C. § 654(a)(1),[1/] by failing to properly install and maintain a Lincoln welder and by failing to deenergize the welder before changing the polarity of the machine. We affirm Judge Riehl's decision but for reasons different than those the judge gave.

---

1/ Section 5(a)(1) provides:

> Sec. 5.(a) Each employer -- (1) shall furnish to each of his employees employment and a place of employment which are free from recognized hazards that are causing or are likely to cause death or serious physical harm to his employees.

I

The case involves a citation issued following the accidental electrocution of a General Motors employee. The incident occurred while the employee was attempting to change the polarity of a Lincoln Welder. The Lincoln Welder, a 300-pound upright motor generator manual arc welder, was located under a workbench close to a wall in General Motors' Pattern Shop. The current and voltage controls were on the front of the welder base. The input to the welder was alternating current at 440 volts. This drove a motor generator, which produced the electrical power used for welding. The output of the motor generator was direct current at a maximum of 30 volts. This power was supplied to the welding electrodes and leads through studs on the back corners of the welder base. To change the polarity of the leads, an employee had to remove both leads and reverse their connection to the studs. Because of the welder's position, this required the employee to reach underneath the workbench around to the back of the welder. An approximately 10-foot long, taut flexible cable, plugged into an outlet about 10 feet away, provided the 440-volt input to the welder.

While the employee was attempting to change the polarity of the welding leads,[2/] he apparently put pressure on the 440-volt input cable of the welder. The pressure was sufficient to pull the cable through the strain release connector, a device on the left side of the welder

---

2/ A report compiled by General Motors after the incident indicates that the employee was experiencing difficulty in obtaining the proper current to perform a particular welding job. Apparently, he believed that reversing the polarity would assist in solving this problem.

through which the cable entered the welder casing. The cable was clamped to the strain release connector to prevent the cable from being pulled out of the welder casing. When the cable pulled loose from the strain release connector, a frayed wire inside the cable was exposed. The employee apparently contacted the exposed wire and was electrocuted. Before the incident, the frayed wire could not be seen by simply looking at the machine.

The Lincoln welder had been used in General Motors' pattern shop for the past fifteen years. The welder received maintenance when it malfunctioned but had not required maintenance in the six months prior to the electrocution. Although there was no routine maintenance program for this machine, operators were instructed to perform a visual check before each use and to report any signs of wear or abuse. Six months before the accident, employees had complained several times that the welder was not maintaining a steady heat supply. An electrician was called to fix the welder. Whether the electrician found anything wrong is not clear but from then until the time of the accident, the welder operated without incident.

General Motors instructed its employees to turn off the switch controlling the welder output voltage whenever they changed the polarity of the welding leads. Employees were not, however, required to deenergize the entire welder by unplugging it. Thus, during the change in polarity, the 440-volt input cable, and other machine parts inside the welder casing, remained energized.

II

At the hearing, the Secretary argued that General Motors had violated section 5(a)(1) of the Act by the manner in which it had serviced

and maintained the Lincoln Welder.[3/] The Secretary noted that the Lincoln Welder's maintenance manual suggested eight possible corrective measures to take when the welder would not maintain heat. According to the Secretary, if General Motors had followed these procedures, the frayed cable wire in the welder would have been discovered and the accident avoided. Generally, the Secretary believed that General Motors did not have a preventive maintenance program sufficiently rigorous to uncover defects in the welder. Also, the Secretary believed the employee should have been required to deenergize the machine by pulling the plug out of the outlet before changing the polarity. According to the Secretary, this is standard procedure in the industry. In the Secretary's view, if the welder had been completely deenergized, the employee would not have been electrocuted.

General Motors argued that the frayed conductor wire which caused the accident was a latent defect and no preventive maintenance program could have discovered the problem. The defect was only discovered when the connector was dismantled and the industry did not normally perform this kind of preventive maintenance. General Motors also countered that the maintenance manual's instructions involved the low voltage generator side of the welder and not the 440-volt side where the de-

---

3/ In the citation, the Secretary alleged that General Motors violated 29 C.F.R. § 1910.309(a) and §§ 400-4 and 400-10 of the National Electrical Code because the flexible cord was too taut and permanent wiring should have been used instead of the flexible cord. However, the citation was amended at the pre-hearing conference to allege a violation of section 5(a)(1) in the alternative. The judge found that General Motors did not violate the cited standards, and that issue is not before us.

fect was located. Thus, even if General Motors had followed the manual, it would not have discovered the defect. Finally, General Motors argued that, while it could have deenergized the entire welder in order to change its polarity, General Motors did not believe this was necessary. Employees were instructed to turn off the welder and no other plant or industry required employees to deenergize or unplug the entire welder when changing the polarity.

Judge Riehl found General Motors in violation of section 5(a)(1).[5/] General Motors petitioned for review, repeating the arguments it made

---

5/ Although Judge Riehl found only one serious violation of section 5(a)(1), his discussion suggests several theories of the violation. Judge Riehl found that,

> The preponderance of the credible evidence of record establishes that Respondent had an improper or inadequate preventive maintenance program.
>
> Respondent also permitted a hazard to exist on the Lincoln Welder in question by permitting a "tautness" of the cable for sometime prior to and up to the death of Respondent's employee. Still another known hazard that Respondent either knew or should have known of was that they failed to have an adequate lock-out procedure; this act of omission constituted the hazard or failure to address the recognized hazard.
>
> Respondent failed to properly train its maintenance employees so that they would deal with such recognized hazards as malfunctioning of the welder prior to the accident; that they failed to take the additional ten minutes to check out all sources of electrical power which would include the plug in, thereby creating the hazard which killed Respondent's employee.
>
> Respondent failed to provide the inspection and preventive maintenance procedures, having a degree of

(continued on next page)

to Judge Riehl. Commissioner Cottine directed review on all of the issues raised by the petition including the following:

> Whether the administrative law judge erred in finding the Respondent in violation of § 5(a)(1) of the Act, 29 U.S.C. § 654(a)(1), by failing to inquire into conditions associated with the operation of the welder that could require implementation of preventative maintenance procedures to assure safe operation.

III

To establish a section 5(a)(1) violation, the Secretary must show that an employer failed to render its workplace free from a hazard that is recognized and likely to cause death or serious physical harm to its employees. See Little Beaver Creek Ranches, Inc., No. 77-2096 (June 30, 1982). The Secretary must also demonstrate that there were feasible means available to abate the hazard. Id.; National Realty and Construction Co. v. OSHRC, 489 F.2d 1257, 1268 (D.C. Cir. 1973).

In this case, most of the evidence and arguments about recognition of the hazard concern the foreseeability of the particular incident as it occurred. For example, the parties extensively litigated whether General Motors was aware of the defect in the welder. The Commission has held, however, that it is the hazard, not the specific incident

---

5/ (continued)

> detail, which would discover hazards in the equipment in use by their employees.
>
> Respondent also had an "inappropriate strain release connector" condition concerning the Lincoln Welder involved in the fatality. A lack of preventive maintenance caused the connection to pull loose, exposing the electrically charged wire which contacted Respondent's deceased employee and electrocuted him.

resulting in injury, that is the relevant consideration in determining the existence of a recognized hazard. See Kansas City Power & Light Co., 82 OSAHRC , 10 BNA OSHC 1417, 1982 CCH OSHD ¶ 25,957 (No. 76-5255, 1982). More specifically, a recognized hazard is a condition or practice in the workplace that is known to be hazardous by either the industry in general or the employer in particular. Kansas City Power & Light Co., supra; Continental Oil Co. v. OSHRC, 630 F.2d 446, 448 (6th Cir. 1980), cert. denied, 101 S.Ct. 1481 (March 2, 1981); Empire Detroit Steel Division, Detroit Steel Corp. v. OSHRC, 579 F.2d 378, 383 (6th Cir. 1978). Although they focused on the specific incident, the parties also introduced evidence about general awareness of risks associated with energized electrical parts. General Motors' electrical engineering consultant testified that in general vibrations can damage an electrical wire. He also testified about electrical malfunctions such as overheating. There was also evidence about general awareness of the risks of servicing energized electrical equipment. Thus, the hazard in this case is electric shock by contact with energized electrical parts during the servicing of equipment.

This hazard is recognized as a matter of common knowledge, as this record shows. General Motors required employees to completely deenergize and lockout electrical equipment when maintenance work was being performed on the equipment. Also, General Motors required employees to partially deenergize welders before changing the polarity. Witnesses for both the Secretary and General Motors testified that deenergization procedures were generally followed to prevent accidental shock and electrocution.

The workplace was not free of the hazard. Defects in electrical equipment may present the hazard of shock or electrocution as long as

some parts are energized. As the record in this case establishes, strain release connectors are not failsafe, and the insulation on wiring can wear out. Accordingly, to free the workplace of the hazard, such equipment must be deenergized whenever it undergoes servicing or modification. Although General Motors required employees to completely deenergize and lockout electrical equipment during maintenance, only partial deenergization was required before changing the polarity on the welder. Because General Motors did not require total deenergization when changing the polarity of the welder, it failed to free its workplace of the recognized hazard. Furthermore, as the record clearly indicates, the likely result of an accident would be either serious injury or death. Contact with electrical parts energized at 440 volts is likely to cause death or serious physical harm.

Moreover, the feasibility of abatement in this case is clear. Deenergization can be achieved by merely pulling the plug. General Motors argues that no other member of its industry takes such precautions. However, as this Commission has frequently noted, abatement requirements are based on feasibility and an abatement order may require practices that are of a higher standard than the industry considers appropriate. Kansas City Power & Light Co., supra; Beaird-Poulan, A Division of Emerson Electric Co., supra. Since the fatal incident in this case, General Motors has instituted complete deenergization procedures whenever the polarity is changed on a welder.

Because all of the elements of a section 5(a)(1) violation are established, we affirm Judge Riehl's decision insofar as he found General Motors in violation of section 5(a)(1) for failing to deenergize

the welder when changing its polarity.[7/] A penalty of $600 is assessed.

SO ORDERED.

FOR THE COMMISSION

Ray H. Darling, Jr.

RAY H. DARLING, JR.
EXECUTIVE SECRETARY

DATED: AUG 30 1982

---

7/ Because we have found a § 5(a)(1) violation on another ground, we do not need to consider whether the judge was correct in finding that General Motors' preventive maintenance was inadequate.

ROWLAND, Commissioner, dissenting:

I dissent from the majority's determination that General Motors violated section 5(a)(1). The Secretary did not establish that it is a recognized hazard to change the polarity of welding leads on a "DC" arc welder when the welder's generator is deenergized. Nor did the Secretary show that General Motors's preventive maintenance was inadequate. Accordingly, I would vacate the section 5(a)(1) charge.

In concluding that the hazard is "electrical shock by contact with energized electrical parts during the servicing of equipment", the majority asserts that the parties' evidence concerned the "general awareness of risks" - such as "vibrations" and "overheating" - associated with electrical equipment. 8/ Throughout the procedings however, both the Secretary and General Motors focused on the specific operation of reversing the polarity of the leads on the welder. For example, the Secretary's primary witness, Mr. Bode, explained:

> [T]he most serious deficiency in this case and most likely the cause of death . . . is the power to that cable [supplying the alternating current] at the time this gentleman was <u>changing polarity</u>. . . . He should have turned off and locked out or unplugged the power . . . before attempting to <u>change polarity</u>. (Emphasis added).

As evidenced by Mr. Bode's testimony, the Secretary contended that reversing the polarity of the leads presented a danger of potential electrical shock if performed when only the generator, rather than the entire welder, was deenergized. Similarly, the testimony elicited by General Motors was directed toward changing the leads' polarity after de-activating the "generator side" or "DC side" of the machine.

---

8/ I note that contrary to the majority's account of the "apparent" cause of the accident, the parties agreed that the exact circumstances of the accident were unknown. Furthermore, I cannot accept the majority's speculative theory that the employee contacted an "exposed" frayed wire, particularly because the wire remained <u>inside</u> the strain release connector after the accident. Indeed, no one discovered the frayed wire until General Motors completely dismantled the connector during its accident investigation.

Since the Commission's definition of the hazard must comport with the legal theory under which the parties tried the alleged 5(a)(1) violation, I conclude that the hazard should be described as potential electrical shock while changing the polarity of welding leads when only the welder's generator is deenergized. United States Steel Corp., 82 OSHRC 35/A2, 10 BNA OSHC 1752, 1755-56, 1982 CCH OSHD ¶ p. (No. 77-1/96, 1982). See National Realty & Construction Co. v. OSHRC, 489 F.2d 1257, 1267, n.40 (D.C. Cir. 1973); Kansas City Power & Light Co., 82 OSAHRC 13/A2, 10 BNA OSHC 1417, 1424, 1982 CCH OSHD ¶25,957, p. 32,542, (No. 76-5255, 1982) (dissenting opinion).

In an effort to establish industry recognition, Mr. Bode and Mr. Segall testified on behalf of the Secretary. However, Mr. Bode's testimony was based mainly on his experience with a different industry, the airline industry. Mr. Segall, the Secretary's expert, merely opined that a lockout "while working on electrical equipment" is "a safe procedure." He did not assert that changing the polarity of the leads - with the generator deenergized - is a recognized hazard warranting a total lockout in addition to the protection afforded by deactivation of the generator. Significantly, both Mr. Bode and Mr. Segall conceded that it is not hazardous to reverse the polarity of the welder's leads if the generator is first turned off. Moreover, Mr. Schifo, General Motor's plant engineer in charge of the Engineering Department, explained without contradiction that neither General Motors nor the industry recognized the hazard of potential electrocution while reversing the polarity of welding leads when the generator is deenergized.

The majority nevertheless concludes that the hazard was recognized because General Motors required its electricians to completely deenergize the welder during maintenance. In my view, this practice does not show recognition because an electrician performing repairs and maintenance examines the internal mechanisms of the

welding machine whereas a welding operator changing the polarity of the leads only contacts the outside of the machine and has no occasion to contact the internal wiring under normal circumstances. In light of Mr. Bode's and Mr. Segall's concessions, and in light of Mr. Schifo's testimony, I conclude that the record does not show the hazard was recognized, either by the industry or by General Motors. See, e.g., Cargill Inc., Nutrena Feed Division, 82 OSAHRC 11/A2, 10 BNA OSHC 1398, 1399, 1982 CCH OSHD ¶25,935, p. 32,484 (No. 78-5707, 1982) (recognition of the hazard, either by the employer or the employer's industry, is an element of the Secretary's prima facie case in proving a violation of the general duty clause.)

Furthermore, the record does not support the Secretary's contention that General Motor's preventive maintenance was inadequate. With respect to preventive maintenance, the Secretary was concerned about an alleged hazard involving a latent defect: the potential electrocution caused by inadvertently pulling a non-visible frayed electrical wire from its location inside the strain release connector, which connects the alternating current cable to the welder, while changing the polarity of the leads on a "DC" arc welder. It is undisputed that a frayed wire inside the strain release connector could not be visually observed and could not be detected by General Motor's maintenance procedures. Moreover, a preventive maintenance program which followed the manufacturer's instructions would not have disclosed a frayed wire in the strain release connector because the manufacturer's instructions pertained only to the "generator side" of the welder, not the "AC side" where the strain release connector and power cable were located. There is no evidence that General Motors should have perceived the need for additional maintenance procedures. Indeed, the record suggests that a power cable and strain release mechanism can never be rendered fail safe, regardless of the type of connector, the tautness of the power cable, or the maintenance procedures followed. See Jones & Laughlin

Steel Corp., 82 OSAHRC / , 10 BNA OSHC 1778, 1782, 1982 CCH OSHD ¶26,128, p. 32,887 (No. 76-2636, 1982) (an employer's duty under section 5(a)(1) is to free its workplace - to the extent feasible - of recognized hazards.) As the Court of Appeals for the D.C. Circuit aptly explained: "Congress quite clearly did not intend the general duty clause to impose strict liability: The duty was to be an achievable one." (footnote deleted). National Realty & Construction Co. v. OSHRC, supra, pp. 1265-1266. Because the record demonstrates that it was not possible to detect or prevent the occurrence of a non-visible, frayed wire inside a strain release connector, I conclude that the Secretary failed to show what further measures General Motors should have taken to render its workplace free from the asserted hazard associated with General Motor's allegedly inadequate preventive maintenance. Therefore, I would vacate the 5(a)(1) allegation.

| SECRETARY OF LABOR,<br><br>Complainant<br><br>v.<br><br>GENERAL MOTORS CORPORATION,<br>a Corporation,<br>CENTRAL FOUNDRY DIVISION,<br><br>Respondent | DECISION AND ORDER<br>OSHRC DOCKET No. 77-3790 |

APPEARANCES: HELEN SCHUITMAKER, Esquire, U. S. Department of Labor, Office of the Solicitor, Chicago, Illinois
For the Complainant

WALLETT BANCROFT ROGERS, Esquire, General Motors Corporation, Detroit, Michigan
For the Respondent

STATEMENT OF CASE

Vernon Riehl, Judge, OSHRC

This is a proceeding pursuant to section 10 of the Occupational Safety and Health Act of 1970 contesting a citation issued by the complainant against the respondent under the authority vested in the complainant by section 9(a) of that Act. The citation alleged that an inspection of a workplace under the ownership, operation and control of the respondent revealed the existence of workplace conditions that violated section 5(a)(2) of the Act for the reason that these conditions failed to comply with certain

occupational safety and health standards promulgated by the Secretary of Labor pursuant to section 6 thereof.

The citation alleges that the violations resulted from a failure to comply with standards promulgated by publication in the Federal Register.

In the alternative the complainant in the first part of the hearing amended his complaint to include a 5(a)(1) type of violation.

A description of the alleged violations contained in said citation states:

> CITATION NUMBER 1, SERIOUS
> 29 CFR 1910.309(a), Item 1A
> Section 400-4, National Electrical Code, NFPA 70-1971, as adopted by 29 CFR 1910.309(a): Flexible cord(s), in the following locations, were used in a prohibited manner:
>
> 29 CFR 1910.309(a), Item 1B
> Section 400-10, National Electrical Code, NFPA 70-1971, as adopted by 29 CFR 1910.309(a): Flexible cord(s) were not connected to device(s) and to fitting(s) that tension would not be transmitted to joint(s) or terminal screw(s):
>
> On the east side of pattern shop in the welder's booth, flexible cord was used in lieu of permanent wiring to the Lincoln Welder (type SAE J V440 AMP 16) which had been in the same location for approximately 15 years and not used in a portable manner. The cord at its fitting was pulled from its terminal. Hazard: shock.

Respondent has submitted a thorough 109 page brief. The complainant has elected not to submit a brief.

As mentioned in the respondent's brief the complainant relies in large part upon the "improper or inadequate (preventive) maintenance" theory. Explicit provisions of the National Electric Code of 1971 ("NEC") say nothing about electrical maintenance and contain no requirements in that regard.

Complainant also relies upon the "tautness" theory as part of its 5(a)(1) claim. This theory is that respondent caused the Lincoln Arc Welder to be installed in such a manner that there was no slack in its power cable, a four-conductor flexible cord.

A third theory is the "impermissible use of flexible cord".

A fourth theory is "impermissible use of flexible cord on a so-called stationary "permanent electrical installation".

Still another part of the 5(a)(1) case is that respondent was alleged to not have an adequate lock-out procedure, and this alleged act or omission constituted a hazard or a failure to address a recognized hazard.

A sixth contention was that respondent's welder was malfunctioning <u>immediately</u> prior to the accident (failing to generate sufficient heat at the DC welding arc) and that respondent's maintenance electricians did nothing to alleviate the problem, by completely fixing what was wrong.

It is also contended that had respondent provided the kind of inspection and preventive maintenance, having the degree of detail suggested by OSHA, the latent defect or defects which caused the accident would have been discovered, and the accident would not

have occurred.

The complainant also alleges an "inappropriate strain relief connector" theory. This theory is that the strain connector which respondent employed was "inappropriate" because its grip was broken by some unknown level of force that was apparently applied to it.

The last theory of complainant is that respondent's use of two clamps or clips to hold the power cord of the welder (a flexible cord) up off the floor for safety reasons, was barred or proscribed by NEC Article 400-4(1) or (4).

DISCUSSION

A preponderance of the credible, probative evidence of record establishes a violation by respondent of the 5(a)(1) provision of the law.

The record does not establish a violation of 29 CFR 1910. 309(a) NFPA 70-1971, section 400.10, or any other section of the electrical code.

The electrical code is quiet vague insofar as situations in the instant case. We will discuss later the testimony of Ben Z. Segall, respondent's expert witness. Mr. Segall was and is one of the members of the committee that wrote the code. On the basis of his testimony we have concluded that the code does not cover the instant situation. However, Mr. Segall in his testimony, coupled with the testimony of Donald Heitman, Dale Shields, Wilfred Haskings, Joseph Body, James Schifo, James Helmholtz and Donald Barnes, establishes a violation of the 5(a)(1) section.

Our decision is not only bottomed on the knowledge of an existing hazard and failure to correct same, it is heavily dependent upon the preventive maintenance failure on respondent's part to maintain a safe workplace.

Preventive maintenance is a part of providing a safe workplace. It is necessary to continuously maintain a workplace in a safe condition. If it is not done, it can become unsafe, and a hazard.

Whether or not respondent used sufficient diligence in its preventive maintenance program to correct and abate dangerous conditions arising out of continuous use, and wearing out of equipment to the point where an unsafe work condition occurs, is a matter of fact to be judged on each cited hazardous condition in the workplace.

We will not attempt to set forth all of the testimony bearing one way or another on the issue of violation but we use selected evidence as typical of the total substantial credible evidence of record.

Evidence substantiating the 5(a)(1) violation includes not only inadequate preventive maintenance, but specifically the evidence relating to the tautness condition of the Lincoln Arc Welder, failure to have an adequate lockout procedure effectively communicated to the electrical maintenance employees, which omission constitutes a hazard, and failure to address a recognized hazard. Also the evidence that respondent's welder was malfunctioning

immediately prior to the accident (failing to generate sufficient heat at the DC Welding Arc) and that respondent's maintenance electricians were not sufficiently advised by management to alleviate the problem by completely fixing what was wrong.

Had respondent had the kind of inspection and preventive maintenance, having the degree of detail suggested by OSHA, the latent defect or defects which caused the accident would have been discovered and the accident would not have occurred.

The evidence also establishes that the strain connector which respondent employed was inappropriate, because its grip was broken by some unknown level of force, which was apparently applied to it, and it had not been adequately inspected for a considerable length of period prior to the employee's death. This part of the evidence in combination with the preceeding establishes a 5(a)(1) violation.

It is generally recognized in all industries that there must be proper preventive maintenance to keep equipment in not only proper running condition, but in safe running condition and use.

Complainant's basic theory was that effective maintenance is essential to the proper functioning of the restraining device, in that improper maintenance aggravated the condition caused by the fixed wiring that was maintained in such a taut condition, as set forth in the evidence (T. 41).

Donald Heitman, compliance officer for the Secretary, testified that he made an inspection of respondent's workplace following a fatality of respondent's employee. Respondent's employee,

Steve Repasy, had been electrocuted while in the course of doing a welding operation. Donald Barnes, safety director for respondent, and Donald Wilson, union steward, accompanied the compliance officer on the walkaround.

The welder's power cable was a flexible cable, approximately 10 feet long, it had a disconnect attachment at one end, and it went into the piece of equipment on the left-hand side of the welder on the side that faced the wall of the shop, and was positioned or placed in there with a restrainer coupling (T. 15). It was brought up to the wall and connected to a surface of the wall by some clips attached to a rigid pipe, and the cable then ran parallel over to a disconnect switch, and plugged in with an attachment plug that came out of the welder, at a degree and angle, and in a taut condition from the welder to the clip attached to the wall (T.17).

The welder involved in the accident had been in the same position for approximately 15 years. It was between five or six years that the welder had been maintained or looked at for maintenance purposes (T. 17). This information was gained from employees of the pattern shop. There were no wheels attached to the welder and the body of the welder was lying flat on the floor. It weighed approximately 300 pounds. Examination of the cord indicated that it had been there for quite some time, painted in with the wall (T. 18). The flexible cable had been there for some length of time, it was permanently attached by clips onto a rigid

pipe and was in a taut position (T. 20, 21). Information indicated that the employee proceeded to change the leads on the welder, caught his arm between the welder and the flexible cord, which was in a taut condition, and put effort or strain on the cord, drawing the flexible cord out of the restraining nut, exposing some bare wire, bare conductor, and caused the condition of shock and injury (T. 21).

Donald Barnes, employee of respondent, provided the compliance officer with a photograph (C-4) which shows the deterioration of the flex cable as it went into the welder and into the restraining device that is connected to the welder. It shows that the deterioration of the insulation on the conductor, in the condition that it had been in, and this is the location that contacted employee in the injury and electrocuted him (T. 31, 32).

There was a rubber bushing in the wire coupling and apparently by possible lack of maintenance, it had let go, and did not provide restraint when the employee put his force against it at the time of electrocution (T. 33). This released the flexible cord, brought the cord out and exposed the bare conductor to the employee. This is confirmed by the photograph C-6.

The compliance officer testified that the various photo exhibits showed that the flexible cable was used in a manner that, over a period of time, had deteriorated and thereby caused a hazard (T. 34). The unsafe condition was using flexible cord as a permanent piece of wiring (T. 34).

There was a relationship between the tautness of the cable and the separation that pulled the flexible cable from its location of its restraining nut (T. 35).

The hazard was that lack of preventive maintenance caused the restraining nuts of the cable to become loose. The compliance officer said that if the restraining nut is loosened up, the flexible cord can be pulled, or the taut condition that it was in, if the employee gets into the location and pulls at it, can pull a flexible cable from out of the restraining nut (T. 39).

The Secretary during the hearing stated that their position was that effective maintenance is essential to the proper functioning of the restraining device, in that improper maintenance aggravated the condition caused by the fixed wiring, that was maintained in such a taut condition (T. 41). Exhibit C-4 shows the restraining nut had been on the wire and showed that the cord pulled out exposing the bare conductor. Donald Barnes informed the compliance officer that this was what occurred; the restraining device did not support the stress and tension that had been placed upon it.

The compliance officer, Mr. Heitman, testified that the lack of preventive maintenance is a recognized hazard of industry in said situations, as the instant case, where there is electrical high voltage. The following discussion establishes this general need in industry to prevent hazards.

JUDGE RIEHL: All right. I have one question. I am not

quite sure what your predicated violation under 5(a)(1) is. What is the situation that you make your finding that there is a violation? What is wrong?

WITNESS: Under 5(a)(1)?

JUDGE RIEHL: 5(a)(1). I haven't got that clear in my head.

WITNESS: The employer has failed to provide a safe and healthy workplace for the employee.

JUDGE RIEHL: Well, what is that from? Lack of preventative maintenance or what?

WITNESS: Yes. It appears that it is preventative maintenance; the condition, as by their statements, that the cord was in a manner that caused a strain on the cord; the location of the piece of equipment in a confined area where the employee had to grope and reach to change the polarity in the operation that he was doing.

JUDGE RIEHL: Now, is the lack of preventative maintenance a recognized hazard in the industry in such situations as this where there is electricity, high voltage?

WITNESS: Yes. (T. 73, 74)

* * *

JUDGE RIEHL: . . . . What kind of evidence would you present besides this picture of this worn out wire in this case? What other evidence, paint or it or whatever else, would there be?

WITNESS: The length of time that it had been there, like I say, the paint, the deterioration, the lack of maintenance. They can't tell whether it is in a deteriorated manner to be able to correct it, to keep it. (T. 75)

* * *

MR HEITMAN
A. The industry has many, many applications where they find that they have to have a lot of maintenance and maintenance force and a maintenance program which constitutes the keeping up of their equipment so that

it can become safe.

* * *

Q. Okay. Now, in the terms of the practice of all industries, what do they do with regard to periodic or preventative maintenance of strain connectors, and what evidence do you base those statements on?

A. Well, if a connector has been loosened up, why, it should be put back in its normal condition or in the condition that it was designed for.

* * *

Q. No. I mean something that you have seen in your inspections of industry or in your acquaintence with industry that shows what you say should be done should be done.

A. Whenever you see a piece of equipment that has been damaged, why, it should be taken out of service and repaired. (T. 77)

* * *

Q. . . . . In what industry have you seen a preventative maintenance program that is addressed towards strain connectors?

A. I can't specifically say what industry, but I can say that in your Pattern Shop, your equipment needed maintenance of that type of nature, and after the fatality occurred, you went in there and repaired at least three of them.

Q. What evidence do you cite to say that our equipment needed maintenance?

A. I observed this, and I was informed.

* * *

JUDGE RIEHL: . . . . What did you observe? . . . .

A. I observed a piece of equipment that was repaired. It was a planer. (T. 78)

* * *

Q. Were these repairs made before this accident or after this accident, or do you know?

A. I was informed that it was after.

Q. Are you aware of any strain connectors that needed repair before the accident?

* * *

A. Yes.

Q. How?

A. By information.

Q. From whom?

A. From an employee.

Q. What was that information?

A. That information was that a type of restraining connector, as such, had been loose for many years.

Q. Is there any indication that this information had been communicated to the Respondent?

A. Yes.

Q. Or any of its agents?

A. Yes.

Q. Who was it communicated to? Did the employee tell you?

A. Yes.

Q. Who? Who did he say it was communicated to?

A. To his supervisors.

* * *

JUDGE RIEHL: If they had used formal preventative maintenance, as such, that other shops have used, can you tell me or not if this condition was known to the

Respondent or should have been known had he used reasonable, ordinary diligence in its preventative inspections? This condition, this wiring is what I am talking about particularly.

WITNESS: Yes, I'm sure. (T. 79, 80)

* * *

Q. What evidence can you cite to show that because this metal connector, in your mind, evidenced a need of maintenance -- what connection is there with any possibility to this needed preventive maintenance, you know?

A. A lack of maintenance.

Q. Different items differ in durability.

A. A lack of observation. In this case, lack of maintenance.

* * *

Q. Yes. You see something wrong some place else, and you conclude that it is going to be wrong throughout the Pattern Shop?

A. It tells me there is a pattern.

Q. Well, fine.

A. A lack of maintenance, possibly.

Q. What does it tell you in terms of some recognized hazard that that has to do with this elbow-shaped connector? What does it tell you there? The two things might be completely different in terms of their durability. So what does it tell you?

A. When you have a lack of -- in a metal condition such as that, why, you can have a lack of continuity for grounding. (T. 83, 84)

Dale Shields, respondent's employee, a machinist had been with the company 12 to 15 years. He worked in the Pattern Shop where the welder was located (T. 77, 78). He worked in the Pattern Shop

for a little over 30 years. He used the welder involved in the accident 4 to 5 times a week up to the time of the accident. The welder was approximately in the same position for the 15 years preceeding the accident. For a while there was a maintenance man who tended the machine but for the last 5 or 6 years there wasn't, unless there was some problem with it.

There were several loose connectors in the Pattern Shop following the accident. Everyone looked for these loose connections including supervision, employees, all looking for problems following the electrocution of the employee (T. 89). Prior to the accident the welder had a problem with fluctuating heat. They called an electrician several times to check it and he would find nothing wrong, so they would go ahead and use it (T. 90). When the welder got to the position where it wouldn't function, then they would replace it. Following the accident they brought in a brand new welder (T. 91).

Prior to the accident the witness Shields had complained to the electrician about the heat fluctuation. It was reported also to the foreman (T. 92). Respondent employee, Wilfred Haskins, employed by Central Foundry for approximately 28 years, was familiar with the Lincoln Welder involved in the accident and stated that it had been in the Pattern Shop about 15 years. The welder was not a portable piece of machinery. Illustrating the lack of preventive maintenance is Mr. Haskins testimony that a grinder he worked on had a coupling that was loose. He brought this to the

attention of the management. Management responded they would get it fixed and have it repaired. They did not do this immediately however and he could not recall the exact time lapse before they got around to it. Management did have maintenance men go around and check various pieces of machinery, also in the maintenance shop. They came around periodically for a time but had not been around for a year or two prior to the accident (T. 104).

Joseph Bode, compliance officer, had worked as an engineer since 1953, had a degree in aeronautical engineering, previously employed by Douglas Aircraft Company in Santa Monica as a design engineer in constructural design and also flight test engineer. He performed every function from aerodynamic demonstrations, structural demonstrations, instrumentation verification, performance verifications, demonstrations to the FAA, and demonstrations to the military. Among his other qualifications he has worked as a welder and studied welding in college in his freshman year (T. 109, 110). The types of machines he performed welding work on were similar to the machine which was involved in the fatality on respondent's premises.

Mr. Bode had an opinion concerning the use and maintenance of the Lincoln Welder involved in the accident. He reviewed the recommendation made by the Lincoln Welder Manufacturer themselves as to the recommended procedure.

He referred to complainant's exhibit C-16, which was a copy of some pages from the operating manual of the Lincoln Welder

furnished by the manufacturer. It refers to a welder of the type that was in question in the fatality. In the maintenance instructions of this welder, it is recommended by the manufacturer that the welder be blown out, the controls and so forth be hosed once every two months, and particularly in dirty locations as cleaning may be necessary every week. The dust in the photographic exhibit indicated that it was not a totally clean place where the welder was located so it would be something like two months or less frequently in which they should be blown out and checked. There is a troubleshooting guide with the exhibit C-16, one of the keys is that the machine failed to hold heat prior to the accident on a constant basis. The manufacturer gives a list of things that should be checked and verified in the event it does not hold heat, of which, apparently the maintenance people were only checking the commutator and the brushes and like parts. One of the items the maintenance men should have been checking is, the fuel circuit which may have a variable resistance connection or intermittent open circuit due to a loose connection or broken wire. This condition should exist at the input, and in the C-5 photograph exhibit where the input cable comes into the start box, which is in the front of the welder, and which also has located the start-stop button for the welder. Mr. Bode stated that previous testimony indicated the respondent was having trouble with the machine holding heat. The Lincoln Welder company had apparently very well established, at least some kinds of typical things that go wrong

with their welder, just as General Motors does indicate to maintenance people what goes wrong with their cars.

Mr. Bode testified that if a maintenance man used this manual as he should have been instructed to do, he would have pulled the cover off the switch, and if there was a defect in the cord at the restraining device, and if that defect was in fact, there, he would have noticed it and he would have observed it, and he would have had the opportunity to repair it before the accident, if, in fact, it was there. Every indication from the fact that respondent was having trouble with the welder repeatedly before this time, although it functioned, "would tend to make me, as a careful engineer, certainly question that, and I certainly would have gone straight to that spot. This is one of the things to check. I would have gone through the whole list, not just the brushes, and looked over everything that might be causing the problem. No one single thing caused the accident. It was generally a breakdown of several things." (T. 116)

> MR. BODE
> A. Again, you have a plug at the end of that cable which could have been unplugged. If it wasn't locked out, certainly it could have been turned off, and at least a safety man could have tagged that or something, some indication, and we have a standard regarding tagging out.
>
> MR. ROGERS: Was it cited?
>
> WITNESS: In this case, no, and we very seldom do. We do go to 5(a)(1) because the standard in that area is extremely weak and poorly written. Therefore, we enforce lockout, and we impose lockout procedures on industry generally through the 5(a)(1) procedure. (T. 121, 122)

* * *

A. I'm saying that had the maintenance man, the electrician that was checking this machine, been properly trained, when he goes to a machine, one, pull the manual each time, see if it has a section in it which most good manuals do, as do yours --

A. Then had he gone down through and done the routine things which he felt might be the cause and still had not located the trouble, he should have been curious enough to go back to the manual at least then to see if there wasn't something he missed that he possibly didn't know about that machine. (T. 131)

* * *

A. The testimony indicates that the electrician was called several times and that each time he came out, looked at the armature, looked at the brushes, checked those, checked for various things in a variety of those conditions, found nothing out of the ordinary and left. (T. 132)

* * *

A. . . . you also know in today's environment, particularly in the last ten years in major industry in this country, due to the extreme economics worldwide, the extreme pressing dollar, the U.S. has shifted from preventative maintenance to catastrophic maintenance with regard to most of its facilities, and this is a damn shame.

A. OSHA didn't exist ten years ago, and this occurred in industry in this country as much as ten, twelve years ago as a result of the economic pressure, not as a result of good engineering practice, because good engineers fought against it and still do.

JUDGE RIEHL: Are you inferring that they are trading off lives and health for profit?

WITNESS: It is the old philosophy, Your Honor. You drive your car until it stops running, and then you take it in to get it fixed, or you operate your car per your manual which will cost you a great deal more money.

Q. Let me ask you this. In terms of this concentenation of these events here in your acquaintance with industry, do you find that it is a common practice for welders using this type of a DC are welder to lock it up when they change their leads? It is a common practice?

* * *

A. We locked out and shut down. (T. 135, 136)

HEITMAN
WITNESS: The pictures show that the flexible cable was used in a manner that, over a period of time, had deteriorated. It had deteriorated creating a hazard.

JUDGE RIEHL: How does that relate to the standard we are set in? This is 1(a) that we are talking about.

WITNESS: That flexible cord was used as a permanent piece of wiring.

JUDGE RIEHL: Is that the main thing?

WITNESS: Yes.

JUDGE RIEHL: Used as a permanent --

WITNESS: The prohibited use of a flexible cord.

JUDGE RIEHL: That is your interpertation of the standard. (T. 34)

* * *

MS. SCHUITMAKER
Q. Is there a relationship between the tautness in the cable and the separation which you just described?

A. Yes.

Q. What is it?

A. Oh, the tautness of the cable has caused a force that has caused probably tension on the terminals. It has pulled the flexible cable from its location of its restraining nut and has created a hazard. (T. 35)

Further questioning by Attorney Rogers elicited the following testimony:

Q. Let me ask you this. In terms of this concatenation of these events here in your acquaintance with industry, do you find that it is a common practice for welders using this type of a DC arc welder to lock it up when they change their leads? It is a common practice?

A. In every shop I have ever been in, in any shop that I had supervision or responsibility for, you bet.

Q. Okay.

A. We locked out and shut down.

Q. How many were those?

A. Four.

Q. And when were those? When did that occur?

A. Starting in 1947.

Q. How many, and where were the shops located?

A. McDonough-Douglas Welding Shop in Torrance, California.

JUDGE RIEHL: How many people were employed there?

WITNESS: Something in excess of a thousand.

Q. In the welding shop?

A. Yes. The whole facility was welding. (T. 136)

* * *

Q. Where else?

A. Packard Bell Electronics facility in Santa Monica, California.

Q. What year was that?

A. About 1959, 1958, somewhere in there.

Q. Okay. And where else?

A. Spectrolab Electronics.

Q. When was that?

A. That was three years after Packard Bell.

Q. In 1961?

A. In early '61. (T. 137)

* * *

Q. Okay. The other shop that you worked in, was that the last?

A. Well, what I am attempting to tell you is, these have been recognized hazards, and as recognized hazards in many major corporations and major facilities for a very long time.

Q. Are they still recognized, to your knowledge?

A. To my knowledge, they are still recognized, and the procedures are still enforced.

Q. In what industries? Where have you seen this done contemporaneous?

A. I know it is done continually in the aircraft industry. As a matter of fact, you will find the FAA will climb over anyone who doesn't.

What about other industries? Do you know that it is being done contemporaneously in other industries?

A. Presently?

Q. Yes.

A. Presently, yes. I spent, up until last July as a compliance officer out of the same office from which it was cited - - (T. 140)

A. * * * Electrical hazards can only be averted by consciously being concerned about lockout procedures.

Q. Okay. I agree. But what I am trying to get at is what is the prevalence of locking out arc welders contemporaneously in industry that you have personal experience with.

A. I have never had to cite it because all the

facilities I was in were doing it, and they were also doing their maintenance. (T. 144)

Respondent's witness Ben Z. Segall, a registered professional engineer, consulting engineer, who examined the electrical equipment in question in the instant case did much to establish a 5(a)(1) violation in response to respondent's attorney Rogers. He made sufficient admissions and stated sufficient facts to establish that respondent was in violation of 5(a)(1).

Mr. Segall is a cut above the average testifying expert witness because he was associated with the code drafting of the present National Electrical Code. He was chairman of the committee that wrote the NEC 309(a) etc. It is to be noted that he has been on that committee for over 40 years. His specialty is electrical engineering, as far as standards and codes are concerned, because he has gone through the entire gamut of electrical engineering, having worked for a utility company for 28 years. He was also an electrical contracting salesman, but the whole time he did one thing, and that was consulting, engineering and writing (T. 162, 163). He examined the various exhibits in the file and testified concerning them.

We cannot set forth his testimony in minute detail but will set forth some of the following that established the 5(a)(1) violation:

MR. ROGERS
Q. Okay. Fine. Let me ask you this, Mr. Segall. I am pointing now to a U-shaped connector on the right-hand

corner where the cable enters the box symbolizing the welder. Do you recognize that form of connection?

A. Yes.

Q. What is it?

A. That is a connect of which we call a strain-relief type of connector.

Q. Is that type of connector required to be used by any portion of the National Electrical Code of 1971?

A. Yes, it is.

Q. What is the section?

* * *

A. That is Section 400-10.

Q. Is there anything impermissible about using this type of connector for this type of installation?

A. Not that I know of, as long as it is recognized, and it is recognized in this particular case because it is listed by Underwriters and the Canadian Standard Association. (T. 172, 173)

* * *

JUDGE RIEHL: Did you write that standard, by the way? Did you write that particular standard?

WITNESS: I was in the panel at that time when we made quite a few of these additions.

JUDGE RIEHL: . . . but the Government has cited 309(a), and it is 400-4.

WITNESS: Yes.

JUDGE RIEHL: How do these two, in your opinion, fit this hookup and the hookup involved in the death?

WITNESS: You are talking about 309(a) or just 400,

JUDGE RIEHL: Well, the first citation is 400-4, and the second one is -- 309(a) is first, and the second one

is 400-10. There are two of them.

MR. ROGERS: Your Honor, our 309(a) is the CFR cite. The only ones that would be reflected are the sections that were adopted by 29 CFR 1910.309(a). In other words, 309 is the language of adoption of this whole code.

JUDGE RIEHL: And it is just a recommendation, but we have made it into a standard?

* * *

JUDGE RIEHL: We have made it an official standard?

WITNESS: That's right, which you have never caught up. You are still operating on the '71. We are now going to the '81. We have had three codes.

JUDGE RIEHL: When is that coming out?

WITNESS: The '81 codes, next year, in '81. But we have had the '71, the '75, and the '78, which we are operating under now. (T. 174, 175)

* * *

MR. ROGERS
Q. All right. Mr. Segall, were you involved in drafting either of the cited parts of Article 400-4 and 400-10?

A. Yes. I may have been Chairman at that time. I was Chairman for one addition of the code. I don't remember. It was right around the time that I was Chairman. But I have been a member of this particular panel, and I have worked on this particular section of the code since I would say, the 1930's.

Q. Okay. Fine. Let me ask you this then, Mr. Segall. Is there anything in that section which, to your knowledge, prevents precisely the kind of installation you find there?

A. No, sir. As I say, we have millions of those installations. (T. 175, 176)

* * *

Q. Let me ask you this. At the time that the standard was drafted, what did the committee have in mind, if anything, in terms of a type of connector or type of strain-relief device that would suffice?

A. Basically, we wanted something that would, under normal conditions, most probably take care of some normal possibilities of people pulling on that cable, and in the course of installation, that it would not give way. * * * (T. 178).

* * *

JUDGE RIEHL: Before you go any further, before OSHA adopted these electrical standards, they were industries own concoctions, right?

WITNESS: Let's say that it is not -- I don't like the word concoction, if you don't mind.

JUDGE RIEHL: Baby or, let's say, they created it. They were the creator.

WITNESS: Yes, but the industry had everyone they could possibly get in there representing, including the Government.

JUDGE RIEHL: For input?

WITNESS: Yes.

JUDGE RIEHL: And when you got through, if I understand you correctly, it was a recommendation, <u>not a law of any kind</u>?

WITNESS: That's correct.

JUDGE RIEHL: <u>So it was more in the nature then, if I could conclude this right, of the recognition of a hazard</u>?

WITNESS: <u>That's correct</u>.

JUDGE RIEHL: <u>So getting down to our instant case, it all depends not on the installation in the recognition of the hazard whether or not there was sufficient preventative maintenance or sufficient continuing diligence to see that it stayed in the recommended state? Is that it</u>?

WITNESS: There is no question about that.

RIEHL: But now it is a law?

WITNESS: Now it is a law, * * *

JUDGE RIEHL: Not that it is a law, if it isn't specific enough, it is still in the nature of a recommendation even though it is a law, and it would be in the 5(a)(1) area if it is not specified, nailed down, by the exact wording of the standard, is that correct?

WITNESS: That' right. (T. 179, 180, 181, emphasis added).

* * *

JUDGE RIEHL: Well, now, here there is some evidence that maybe this wasn't inspected for some considerable length of time. That is preventive maintenance, I know, but that would be partially ignorance, would it not, if they didn't take the normal care that industry does for electrical or any other installation, machine or whatever?

WITNESS: I would say any industry that hired people like that would be very remiss, yes. (T. 196, 197, emphasis added)

* * *

JUDGE RIEHL: So in other words, one might say that the ideal procedure would be to make sure that the power was disconnected or de-energized on the AC side?

Segal
WITNESS: Yes, sir, for a lockout. (T. 204)

* * *

Q. Are lockout procedures while working on electrical equipment recognized?

A. Very definitely.

JUDGE RIEHL: Recognized as what?

WITNESS: As a safe procedure.

JUDGE RIEHL: To prevent a hazard?

WITNESS: Yes, prevent accidents.

* * *

Q. Is it recommended that an employer or anyone utilizing electrical equipment put a service loop on the cable to the equipment?

A. That is done very often, yes, I would recommend it in most cases.

Q. I am referring to Complainant's Exhibit C-3 which is entitled Preliminary Report of Fatality, and I am referring particularly to Page 2, the bottom of the page where it is entitled Immediate Action Being Taken and where it discusses the de-energization of the electrical equipment.

Referring to this, Mr. Segall, does this recommendation make any mention of de-energizing equipment only on the DC side?

A. This says the power supply, so I would say that is on the AC side. (T. 213, 214)

From the foregoing it is evident respondent's witness Segall both on direct-examination and when cross-examined by the Government's attorney has made sufficient admissions to the effect that the lack of proper maintenance and the condition of the equipment preceeding the accident as set forth by the various exhibits establishes a 5(a)(1) violation. This is so for either knowingly not doing what is proper, or, should have known what to do as proper to prevent a known hazard.

An excellent example of respondent's failure to furnish proper preventive maintenance or to properly instruct their maintenance people in doing a proper inspection when checking equipment, is the following testimony as set forth in the record. Witness Schifo, respondent's plant engineer in charge of Engineering Department,

testified as to the following:

WITNESS: If we had taken the complete piece of equipment down to the point where we pulled this cable out of the connector for some reason, then we would have seen it. But unless we actually take this connector apart, then there is no way to find the deficiency.

JUDGE RIEHL: If your safety quit short of that point in the box, that is not a consideration as far as you are concerned?

WITNESS: At that point in time when all we are looking at would be normal maintenance on the item or looking at a reason for a voltage fluctuation, no, we would not look there. It would totally be out of the question at that point.

JUDGE RIEHL: Thank you.

WITNESS: It would only be looked at with a total rebuilding of the welder.

MR. ROGERS
Q. Why would it be out of the question? Is this because of lack of concern for safety, or it this because of some technical reason?

A. This is because the problems did not indicate any safety problem at the time. That there is a fluctuation on the generator side of a welder, now, that does not warrant rewiring the total AC side, and that is what the problem involved. That would be a total rebuild of the welder. It was just not warranted especially since it ran six months apparently with no problem.

JUDGE RIEHL: How much time would it have taken to open all the sides and looked at it? Half an hour, hour?

WITNESS: What I am saying is if we were --

JUDGE RIEHL: Just answer my question. How much time would it have taken you to take the whole box aside and look at it? Half an hour, longer or less? In other words, if you unscrewed, took a wrench or whatever is necessary.

WITNESS: Just to inspect a wire. If we knew there was something wrong?

JUDGE RIEHL: Regardless of what the reason, how long would it take you?

WITNESS: A total inspection to get to that point?

JUDGE RIEHL: To inspect that box where the wire goes in.

WITNESS: To inspect the box, all you would do is open the cover in a matter of minutes. But if --

JUDGE RIEHL: I'm not talking about this burned wire. How long would it take you to open up and look at that part where the wire was, roughly speaking, in minutes, seconds, hours, weeks, whatever?

WITNESS: To dismantle it and to get to the wire, it would probably take <u>ten minutes</u> if we knew there was a problem there. (T. 252, 253, 254, emphasis added)

JUDGE RIEHL: That is all I wanted to know.

* * *

JUDGE RIEHL: What does one of those cables cost, the one you have got there?

WITNESS: It would be a matter of dollars.

JUDGE RIEHL: And that is how old?

WITNESS: I don't know the exact age. It is somewhere - -

JUDGE RIEHL: Ten, fifteen years?

WITNESS: Fifteen years, plus. (T. 255)

* * *

JUDGE RIEHL: So ten bucks would buy the wire?

WITNESS: It would buy the wire. The insulation would probably cost you another 10. (T. 256)

Previous credible evidence of record indicates that one of the places that would have surely been looked at would be the box itself in checking out the wire if everything else did not indicate

a problem with a welder as per the manufacturer's trouble-shooting guide. We have carefully checked respondent's brief which is very thorough and feel that he is correct in that the Secretary did not make a case in regard to the violation of the electrical standard. However, respondent is in error in his various arguments attempting to show that the respondent, General Motors, had a proper preventive maintenance program. The transcript is 267 pages of somewhat contradictory testimony but the preponderance of the credible evidence establishes that respondent has been very negligent in its preventive maintenance program and allowed various parts of machinery to lie for a period of from 5 to 15 years without any sort of examination or correction. Part of this is borne out by the fact that a number of pieces had to be repaired following a death. They would probably have gone another five years according to the various statements made by various respondent's witnesses had not the death brought attention to the situation in the Pattern Shop.

It is a recognized hazard in industry to "see a piece of equipment that has been damaged" and fail to take it out of service to repair it (T. 77).

Respondent failed in instructing its maintenance people to properly check out a piece of equipment, and in particular to check it out as per the owner's manual, on a periodic basis; in particular to have checked it out following the various failures in which it was not properly put back into total function. The evidence establishes very definitely that the whole thing could have

taken about ten minutes more, perhaps ten dollars more worth of expense to have made the welder in question safe. The safety department of respondent has just about totally failed in this particular instance, and certainly did not properly instruct their repair people as to proper procedures in connection with welders or any other material, when something is wrong. Certainly they should have taken ten more minutes to run everything down that could be possibly wrong with the function of the machine, and this would most certainly include the plug-in part of the equipment and the wires involved at the point where the electricity first began to flow.

The years-old stale paint on the wire involved is telling, physical testimony of a complete lack of maintenance on the equipment involved.

Respondent in its brief argued that the Secretary's own witness, Mr. Shields, indicates that generally when the welder was checked for insufficient heat the electricians generally felt the armature to be the cause (T. 91).

The electrician should have followed all of the approved techniques for checking out equipment when there is a malfunction. This included every part of the equipment that deals with the conduit of electricity.

A preponderance of the total credible evidence of record from all of the witnesses, coupled with the exhibits in evidence firmly establish the fact that respondent has had a very poor preventive

maintenance program insofar as the Pattern Shop is concerned. Respondent's attorney has made a good number of arguments against this but the evidence totally overwhelms this side of the discussion.

Respondent's attorney indicates that the OSHA case was based on a plethora of hearsay which was in no way corroborated. This is not so. The total testimony consisted of some admissions by the respondent's authorized supervisory people, the exhibits themselves are the best credible, probative evidence of respondent's lack of preventive maintenance.

One of the things that establishes a violation of 5(a)(1) is the testimony of respondent's expert witness, Segall who was one of the authors of the electric code. He established the fact that the code is quite vague and ambiguous, was never intended to be set forth as a law, and was only adopted by the Secretary along with all the other ANSI standards as a move to get the Act started. The witness, Segall, testified that they have reduced the code now to 100 pages of simplified language which will make it much easier to understand and set forth the requirements with more specific detail.

Complainant has definitely not carried forth the burden of proof of proving a violation under any of the electrical code provisions.

## SUMMATION

1. The complainant has not carried the burden of proving the

violation of 29 CFR 1910.309(a), section 400-4 and 400-10 National Electrical Code, and FPA 70-1971.

2. On the other hand the preponderance of the credible evidence as given by Ben Z. Segall, Donald Heitman, Dale Shields, Wilfred Haskins, Joseph Bode, and James Schifo establishes respondent is in violation of the 5(a)(1) provision of the Act.

3. The preponderance of the credible evidence of record establishes that respondent had an improper or inadequate preventive maintenance program.

4. Respondent also permitted a hazard to exist on the Lincoln Welder in question by permitting a "tautness" of the cable for sometime prior to and up to the death of respondent's employee.

5. Still another known hazard that respondent either knew or should have known of was that they failed to have an adequate lockout procedure; this act of omission constituted the hazard or failure to address the recognized hazard.

6. Respondent failed to properly train its maintenance employees so that they would deal with such recognized hazards as malfunctioning of the welder prior to the accident; that they failed to take the additional ten minutes to check out all sources of electrical power which would include the plug in, thereby creating the hazard which killed respondent's employee.

7. Respondent failed to provide the inspection and preventive maintenance procedures, having a degree of detail, which would discover hazards in the equipment in use by their employees.

8. Respondent also had an "inappropriate strain release connector" condition concerning the Lincoln Welder involved in the fatality. A lack of preventive maintenance caused the connection to pull loose, exposing the electrically charged wire which contacted respondent's deceased employee and electrocuted him.

FINDINGS OF FACT

1. Respondent maintenance procedures, coupled with its lack of preventive maintenance over a period of five years or more caused a hazard in the Lincoln Welder which electrocuted respondent's employee, Steve Rapsy. The accident happened in the Pattern Shop of Central Foundry. At the time of electrocution Mr. Rapsy was a welder performing a welding operation for respondent.

2. The Lincoln Welder involved in the fatality was upright and weighed approximately 300 pounds. It was sitting flat on the surface of the floor without portable wheels. The welder had been placed in a void space underneath one end of a workbench the space being about 27 inches in width.

3. The manufacturer furnished respondent a Lincoln Upright Welder Brochure for the maintenance of a welder similar to the one involved in the fatality.

4. The welder's power cable was flexible. It was approximately 10 feet long and had a disconnect attachment at one end, and it went into the piece of equipment on the left-hand side of the space or on the side that faced the wall of the shop and was positioned in there or placed in there with a coupling, restrainer coupling.

5. The coupling supported the cable into the welder.

6. Management personnel accompanying the compliance officer on the inspection informed the compliance officer that the cable was attached to the welder with a restraining device which was brought up to the wall and connected to the surface of the wall by some clips attached to a rigid pipe, it then ran parallel over to a disconnect switch and plugged in with an attachment plug that came out of the welder at degree and angle and was in a taut condition from the welder to the clip attached to the wall (T. 16, 17).

7. The welder had been in the Pattern Shop approximately 15 years. There had not been a preventive maintenance program in connection with this welder for many years, at least between 5 and 6 years that the welder had been maintained or looked at for maintenance purposes (T. 17).

8. Exhibits of record show that the cord was painted and had been there for a long painted in with the wall.

9. The flexible cord was placed in a taut, fixed condition causing it to be strained and put tension on to the terminals, which caused the welder to be electrocuted, when the wires were pulled out of the restraining nut which held it. The restraining device that was connected to the welder, where the power lead goes into the welder and supports and restrains the flexible cable in the welder, was pulled loose because of weakness caused by a lack of maintenance. This did not provide restraint when the employee put his force against it while working on the machine. The force

released the flexible cord and brought the cord out and exposed the bare conductor to the employee's body thereby electrocuting him (T. 32, 33).

10. Photo exhibits establish that the flexible cord cable used in a manner that, over a period of time, had deteriorated, thereby creating a hazard (T. 34).

11. The tautness of the cable had caused a force that caused tension on the terminal. It pulled the flexible cable from its location of its restraining nut and thereby created a hazard (T. 35).

12. At one time the respondent had a maintenance program that was carried on by an employee; that employee had retired; since then there hadn't been any maintenance on the welders of respondent's Pattern Shop. Respondent had not made any maintenance on the Lincoln Welder in approximately five or six years, thereby creating a hazard which caused the electrocution of respondent's employee.

13. Such equipment and other equipment of like nature which had the same kind of restraining nut, which must be repaired in order to get it back in its proper shape, following lack of preventive maintenance, creates a hazard. Such equipment requires periodic preventive maintenance.

14. Effective maintenance is essential to the proper functioning of the restraining device, in that in improper maintenance aggravated the condition caused by the fixed wiring, that was

maintained in a taut condition (T. 41). If the power cord had not gone through the two restraining clamps, there was no way the accident which electrocuted respondent's employee could have happened (T. 57, exhibit number C-6).

15. Lack of preventive maintenance is a recognized hazard in industry in such situations as where there is electricity of high voltage (T. 74).

16. Whenever preventive maintenance in industry finds a piece of equipment that is damaged, it is taken out of service and repaired (T. 77). Following a fatality to respondent's employee respondent's maintenance people went into the Pattern Shop and repaired several pieces of equipment with like defects.

17. If respondent had used formal preventive maintenance, as other such shops have used, it knew or should have known of the hazardous condition, if they used reasonable, ordinary diligence in such preventive maintenance inspections.

18. Respondent had in its possession the maintenance instructions from the manufacturer of the welder. This manual of instruction recommended that the welder be blown out, the controls and so forth be hosed once ever two months, and particularly in dirty locations as cleaning may be necessary every week. It would be something like two months or less frequently in which they should be blown out and checked. Respondent's trouble-shooting manual furnished by the manufacturer informed respondent that there are a few places that become important with relation to preventive

maintenance and trouble-shooting. One key is that if a machine fails to hold heat constantly. There are eight items mentioned by the manufacturer that should be checked and verified in the event that it does not hold heat, of which the maintenance people checked only the commutator and the brushes, and that type of thing. One of the items that respondent's maintenance people should have been instructed in checking is the field circuit could have a variable resistance connection or intermittent open circuit due to a loose connection or a broken wire. This condition could exist at the input and in the C-5 photo exhibit where the input cable comes into the start box which is in the front of the welder and which also has co-located the start-stop button from the welder.

19. The Lincoln Welder Manufacturer had well established some kinds of typical things to go wrong with their welder just as General Motors does to indicate to maintenance people what goes wrong with cars.

20. If the General Motors maintenance people had been properly instructed in the use of the Lincoln Welder Manufacturer's manual, he would have pulled the cover off of the switch, and if there was a defect in the cord at the restrainer device, and if that defect was in fact there, he would have noticed it, and he would have observed it, and he would have had the opportunity to repair it before the accident, if, in fact, it was there. Every indication from the fact that respondent had trouble with the welder repeatedly before the time of the electrocution, although it

functioned, would tend to make a careful engineer certainly question and certainly would have gone straight to that spot as one of the things to check. A properly instructed maintenance person would have gone through the whole list of problems as listed by the manufacturer, not just the brushes, and then looked over everything that might be causing the problem.

21. Respondent's investigation of the accident (C-3) made a finding that the most probable cause of electrocution was "reaching for the terminal, his left arm apparently applied pressure to the 440 volt power cable which was taut, thus pulling the cable out from the strain connector exposing a section a bare wire, with which his left arm most likely made contact". This General Motors' report coincides with the preponderance of the credible evidence of record from both respondent and complainant's witnesses and also considering the various exhibits.

22. Respondent's safety or preventive maintenance program did not have a lock-out system which could have been turned off, a safety man could have tagged such lock-out system giving some indication to both the party that worked with the machine and the one who maintains it (T. 121). The compliance officer did not cite respondent for this failure, giving as his reason that they go to the 5(a)(1) citation because the standard in that area is extremely weak and poorly written. Therefore, the OSHA in force is locked out, and imposes lock-out procedures on industry in general through the 5(a)(1) procedure (T. 122).

23. Electrical hazards can only be averted by consciously being concerned about lock-out procedures (T. 141).

24. 29 CFR 1910.309(a) and the provisions of electrical standards thereunder were originally recommended standards by industry for adoption by local authorities. The Secretary has adopted this provision as an official standard. Respondent's witness, Mr. Segall, was involved in the drafting as chairman of the commission that created 309(a). His testimony that there was nothing in this section, which to his knowledge, prevents precisely the kind of installation found at the time of the electrocution.

25. The intention of the committee headed by Mr. Segall was, under normal conditions, they wanted the use of something that most probably would take care of some normal possibilities of people pulling on a cable, and in the course of installation, it would not give way. Before OSHA adopted the electrical standards they were industry's standards, in combination with other interested parties' recommendations for safety, pointing out hazards, not a law of any kind.

26. These standards created by industry and adopted by the Government were in the nature of the recognition of hazards (T. 179, 180). They made recommendations to overcome various hazards. In the use of these industry created standards, it all depended not on the installation and recognition of the hazard whether or not there was sufficient preventive maintenance, or sufficient continuing diligence to see that it stayed in the recommended state.

Now it is the law, and before becoming a Federal law it used to be on the basis that municipalities and states would adopt a specific issue. Mr. Segall helped cities write the standard such as the city of New Orleans, Jacksonville and other cities.

27. Mr. Segall agrees now that it is the law, if it isn't specific enough, it is still in the nature of a recommendation. Even though it is a law, and it would be in the 5(a)(1) area if it is not specified, nailed down, by the exact wording of the standard.

28. Mr. Segall responded to the following question: "Well, now, here there is some evidence that maybe this wasn't inspected for some considerable length of time. That is preventative maintenance, I know, but that would be partially ignorance, would it not, if they didn't take the normal care that industry does for electrical or any other installation, machine or whatever?" by saying that "industry that hired people like that would be very remiss . . . ." (T. 196, 197)

29. Mr. Segall stated that the fact that the accident occurred indicated to him that a proper lock-out procedure hadn't been followed: "If you set a lock out, I would say that the entire thing would have to be disconnected." (T. 203) Mr. Segall testified that the ideal procedure would be to make sure that the power was disconnected or deenergized on the AC side for a lock out.

30. Mr. Segall testified that lock-out procedures while working on electrical equipment is recognized as a safe procedure

to prevent a hazard, or accidents. It would take only ten minutes for the respondent's maintenance employees to inspect the box where the wire goes in and it would cost only ten dollars to replace the wire if it was found defective.

## CONCLUSIONS OF LAW

1. Respondent corporation is an employer as defined in the Occupational Safety and Health Act of 1970, and is subject to the jurisdiction of the Occupational Safety and Health Review Commission.

2. Complainant has failed to prove a violation of 29 CFR 1910.309(a) and sections 400-4, and 400-10 of the National Electrical Code.

3. Respondent is in violation of section 5(a)(1) of the Act.

4. Respondent failed to use sufficient diligence in its preventive maintenance program to correct and abate dangerous conditions arising out of continuous use, and wearing out of equipment to the point where an unsafe work condition occurred, thereby causing the death of respondent's employee.

5. The use of preventive maintenance is a part of providing a safe workplace for employees. It is necessary to continuously maintain a workplace in a safe condition. Failure to use sufficient preventive maintenance of a workplace is a violation of the duty to provide safe workplaces for employees.

6. Under the circumstances prevailing respondent failed to correct a "tautness" condition of the cable which caused

respondent's employee's death from electrocution. Respondent failed to properly advise its maintenance crew and to furnish adequate lock-out procedures in the operation of the Lincoln Welder involved in the employee's electrocution.

7. Respondent was aware of respondent's welder malfunctioning prior to the accident and failed to provide sufficiently trained maintenance engineers to thoroughly check out the condition and thereby discover the defect in the connection which caused respondent's employee's death from electrocution.

8. Respondent failed to provide the kind of inspection and preventive maintenance, having the degree of detail suggested by OSHA to discover latent defect or defects such as the one which caused the accident and death of respondent's employee.

9. A penalty of $600 for the violation of the 5(a)(1) citation is appropriate.

DECISION

Based upon the above findings of fact and conclusions of law, it is hereby ORDERED:

1. Serious citation number 1 is vacated.

2. Respondent is in violation of the amended complaint (5(a)(1)) citation. A penalty of $600 is assessed.

| | : | |

DECISION

Before ROWLAND, Chairman; CLEARY and COTTINE, Commissioners.

BY THE COMMISSION:

An order of Administrative Law Judge John S. Patton is before the Commission on interlocutory appeal. In Docket No. 78-2880, Judge Patton ruled that the International Chemical Workers Union had a right to be heard on its objections to a settlement agreement between the Secretary of Labor and Englehard Industries. The judge's ruling is consistent with our decision in Mobil Oil Corp., Docket No. 77-4386 (Aug. 6, 1982). Accordingly, we affirm the judge's ruling.[1/]

---

1/ Chairman Rowland dissents from the affirmance of the judge's ruling in No. 78-2880. In his view, the Commission lacks authority to consider employee objections to settlement agreements that are not related to the period for abatement. Mobil Oil Corp., supra (Rowland, Chairman, dissenting). In this case, the Union objects to the reclassification of a violation from "willful" to "serious." As that objection is unrelated to the abatement period, Chairman Rowland would approve the agreement without affording the Union a hearing on its objection.

In Docket No. 78-3251, all the parties agree that the settlement should be approved and the case severed from No. 78-2880. Accordingly, the two cases are severed. 29 C.F.R. § 2200.10. In Docket No. 78-2880, the judge's ruling is affirmed, and the case is remanded to the Chief Judge[2/] for further proceedings consistent with this opinion. In Docket No. 78-3251, the settlement agreement is approved. 29 C.F.R. § 2200.100.

SO ORDERED.

FOR THE COMMISSION

Ray H. Darling, Jr.

RAY H. DARLING, JR.
EXECUTIVE SECRETARY

DATED: AUG 30 1982

---

2/ Judge Patton has retired.

| Intervenor. | ) | |

## CERTIFICATION AS TO INTERLOCUTORY APPEAL

On August 21, 1978, an order was entered granting the motion of International Chemical Workers Union to intervene as a party in these consolidated cases. On October 18, 1978, a stipulation of settlement agreement, executed by complainant and respondent on October 17, 1978, was filed. The intervenor did not join in the settlement agreement. The intervenor filed a statement in opposition to the settlement agreement. The objections of intevenor as to case number 78-3251 involved only questions of law, and this judge entered an order stating that the objections of intervenor as to case number 78-3251 were without merit.

Some of the objections of intervenor as to case number 78-2880, however, involved questions of fact; and it was, therefore, ordered that a hearing be held as to certain of intervenor's objections relating to case number 78-2880.

Since it was not known whether the parties to the settlement agreement would have settled case number 78-3251 if the issues in case number 78-2880 had not been settled, the order did not sever the cases and did not approve the settlement as to case number 78-3251. The order gave complainant and respondent ten days within which to state in writing whether, in view of the settlement agreement not being approved as to case number 78-2880, there were any objections to the cases being severed and the settlement agreement being approved as to case number 78-3251. Respondent replied stating that respondent did not object. Complainant has not replied but the ten days allowed have not yet expired.

It is the position of complainant and respondent that the intervenor does not have standing to object to the settlement agreement and to prevent the settlement agreement from being approved. The respondent maintains that the intervenor has a right to object to a settlement agreement only insofar as it relates to designated abatement dates.

On December 29, 1978, the respondent filed a timely request for Judge's certification for interlocutory appeal.

It appears that the law is well settled as to the issues raised by the objections of intervenor as to case number 78-3251. Certain of the objections as to case number 78-2880 involve questions of fact. It appears that the standing of an intervenor to file objections and prevent the approval of a settlement agreement involves an important question of law concerning which there is substantial ground for difference of opinion. If the judge is in error and the ruling of the judge is not reviewed until a trial on the merits of the case, a case entirely settled before trial on the merits will be completely litigated.

It is, therefore, certified that the ruling of the judge refusing to approve the settlement agreement as to case number 78-2880 and ordering that hearing be held involves an important question of law concerning which there is substantial ground for difference of opinion, and an immediate appeal from the ruling will materially expedite the proceedings.

In view of the certification and the fact that the settlement agreement covers both cases, the cases will not be severed at this time and this judge will not at this time enter a further order as to case number 78-3251.

Dated this 29th day of December, 1978.

## DECISION AND ORDER

John J. Morris, OSHRC Judge:

A citation filed herein alleges a violation of the Occupational Safety and Health Act of 1970 (29 U.S.C.A. 651 et seq., hereafter "the Act".). Complainant asserts a violation occurred by reason of certain practices and procedures at respondent's oil refinery in Mandan, North Dakota. Complainant issued his citation on April 16, 1976 after an inspection on April 13, 1976. Respondent filed a notice of contest on May 7, 1976.

Citation 4 alleges a serious violation of 29 CFR 1910.106(e)(9)[1/] and in the alternative 5(a)(1) [29 U.S.C.A. 654(a)(1)] of the Act. It reads:

> On or about April 13, 1976, and at times prior thereto, the employer failed to furnish his employees a place of employment which was free from recognized hazards that were likely to cause death or serious physical harm to his employees in that:
>
> (a) The established procedures concerning maintenance and operating practices of the mixing unit portion of the fluidized bed incinerator unit were not adequate to control leakage and prevent accidental escape of the combustible liquid contained therein through the mixer motor shaft bearing packing gland and other appurtenant parts of the process.
>
> (b) Flammable liquid spills around the fluidized bed incinerator unit have not been promptly cleaned up or otherwise effectively rendered harmless and employees have been required to perform work duties while walking through, standing in, and surrounded by said spills.

(Proposed civil penalty: $700.)

1/ The complaint sought to vacate this alleged violation.

The cited statute reads:

> §654. Duties of employers and employees.
> (a) Each employer-
> (1) shall furnish to each of his employees employment and a place of employment which are free from recognized hazards that are causing or are likely to cause death or serious physical harm to his employees;

Complainant's evidence: respondent's oil refining process requires the cleaning of its storage tanks. Residual sludge from the tanks is pumped to a sludge box, then to a sludge feed tank where it is mixed. It is thereafter fed into a fluidized bed incinerator (FBI). Torch oil then ignites the mixture of combustible sludge and spent caustic (sodium hydroxide). (Tr. 6-8, 13, 23, 24, 61, 62, 64; Exhibits 1, 4, 13). The alkylation process burns the sand-like caustic and sludge at approximately 1200° to 1300° F. (Tr. 4-5, 29, 30). An operator 200 yards away monitors the FBI's fluctuating temperatures and flow speeds (Tr. 4, 19, 22). The FBI vaporizes the caustic, but some residual accumulates. Workers empty the residual as needed, usually daily. The residual can be blown into a nearby open dumpster box through a pipe. Occasionally clinkers, which have blocked the flow of the caustic, must be broken loose with a rod (Tr. 27, 28, 42-44, 100). In dumping the hot caustic occasionally spills, the size of a wheelbarrow, occur (Tr. 27, 28, 31, 44, 64, 65, 83; Exhibits 5, 6). Several fires have been caused by the dumping of the hot material (Tr. 92).

Hydrocarbon (oil) leakage occurs at the packing gland on the sludge tank mixer and at the FBI pump. Complaints were lodged by workers as long as two years ago when the sewers plugged up (Tr. 11, 15, 32, 33, 56, 57, 65, 86, 99-101; Exhibit 7). Oil and water has accumulated to a depth of 2 to 3 inches on the concrete floor; on the date of the inspection oil and water was 2 to 4 inches deep (Tr. 33, 58). Ameliorating short term measures by respondent included: frequent tightening of the mixer packing gland; installing a sand bag dike; placing wooden planks on the floor for the workers to walk on between the FBI and the sludge feed tank; applying an oil absorbing compound (Tr. 33, 34, 37).

On the date of the inspection the sludge spill was greater than normal; further, the packing gland was leaking badly (Tr. 35-36, 60, 101).

Complainant's abatement proposals: clean the spills, repair the leaking packing gland, carry away future spills (Tr. 78).

Respondent's evidence: at the Mandan refinery any emulsion of oil and water that cannot be readily separated is burned in the FBI. Respondent pioneereed this process and equipment in 1969. It disposes of waste products without emitting smoke or odor into the atmosphere. Prior to its development sludge was burned in open pits (Tr. 108, 109, 110, 117, 143, 150, 219; Respondent's Exhibit A, C-2). The FBI disperses 35 to 40 barrels of spent caustic each day (Tr. 117-118, 126, 151, 152). When the sewer plugged in 1974 leakage at the FBI packing gland became a problem; the high silica aluminum compound in the lines eroded the

mixer shaft and increased leakage. A ditch was constructed to a sump to handle the accumulation of leakage. Also in 1974 the area was diked with sandbags (Tr. 113, 127, 139, 141, 144, 155-156, 168, 170, 173, 187, 188, 200). An evolving set of problems were countered with an evolving set of solutions (Tr. 145).

The leakage became increasingly worse. Short term efforts at solving the problem included replacing sand bags, installing a new packing gland, cleaning the deck (15 to 20 times), pumping out the sump hole (8 times) (Tr. 203-206, 157). In 1974 respondent's officials suspected a mechanical problem in the cyclone scrubber system; later they suspected a design deficiency in the sewer system (Tr. 160, 162, 169, 184). Respondent's officials now believe the problem is solved though the mixer still leaks from time to time (Tr. 174). Packing glands always leak in a minimal amount for lubrication purposes (Tr. 174). A high estimate of leakage: 2 to 3 barrels per day (Tr. 176).

In September 1975 respondent's managers commenced long range efforts to solve the problem. They contacted various mixer manufacturers. A new sewer was designed. Final sewer drawings were drafted and construction bids were in process on the date of the instant inspection. Work began in June 1976 (Tr. 210, 211, 214, 215). The sewer system is now adequate to handle the problem; no potential for a repeat performance exists at the FBI (Tr. 218, 221).

A flash point of a liquid is the minimum temperature at which it gives off sufficient vapor to form an ignitable mixture with the air near the surface of the liquid or within the vessel used. Various flash points discussed in the evidence included:

112° F; Mandan sludge
85° F; Xylene
-40° F; Gasoline
90° F to 175° F: 1 month variance in Mandan sludge in 1976.

(Tr. 3A, 248, 255, 256, 258-261, 280.)

There is a probability a fire would occur during the FBI dumping process if some hot material fell on the sludge leakage (Tr. 277, 281). Prior fires were slow burning, minor and easily extinguished (Tr. 282).

On the date of the inspection a pump hose, inadvertently positioned, functioned as a siphon thereby spilling a large amount of oil on the ground. An accident of this type had not previously occurred. It was abnormal (Tr. 111, 128, 134, 137, 141, 143).

## ISSUES

Complainant contends that:

--he has met his burden of proof to establish a violation of the general duty clause.

--that the violation is serious in nature;

--that respondent has abated the hazard therefore complainant need not show feasible methods of compliance.

Respondent contends that:

--the evidence fails to establish a recognized hazard likely to cause death or serious physical injury;

--that complainant failed to demonstrate the feasibility and utility of the steps that respondent should have taken to avoid the citation;

--that complainant failed to establish a violation of the Act on the date of the inspection hence the citation must be vacated.

The Oil, Chemical and Atomic Workers International Union contend that:

--the facts support the alleged violation.

Complainant introduced evidence of a continuing oil leakage at the fluid bed incinerator prior to the date of the inspection. The thrust of the complaint and the citation is toward the "established procedures concerning maintenance and operating practices" (Citation, complaint ¶IV). Evidence in support of this allegation must almost necessarily include events prior to the date of the inspection. Respondent correctly states the law: a violation must also be shown on the date of the inspection. However, respondent cannot escape the citation by proving that an extraordinary and unanticipated spillage occurred on the date of the inspection if the underlying defective violative conditions existed at the same time.

The evidence establishes a leakage of 2 to 3 barrels of sludge each day at the fluid bed incinerator mixer. Workers in close proximity dumped the sand like residual FBI material. Temperatures of the residual range between 1200 - 1300° F.; spills occur. Respondent's safety expert, a consultant on 50 or more refinery fires, acknowledged the probability of a fire under these circumstances. Literature received in evidence including the American Petroleum Institute publication "Fire Protection in Refineries" recognizes oil leaks as a hazard and proscribes remedial procedures (Exhibits 22, 23). Three minor fires did occur at this refinery including one at the dumpster box.

The thrust of respondent's defense is directed to the proposition that no danger of a substantial fire exists due to the low ignition qualities of the Mandan sludge. This defense conflicts with respondent's evidence, including the illustrative movie (not offered in evidence). The low flash point of the Mandan sludge (90° F.) approaches the flash point of xylene (85° F.) which was shown to be a more readily ignitable substance.

Respondent's knowledge of the flash points of the sludge and the probability of fires at this location establishes actual knowledge of the hazard. Such knowledge is sufficient for the hazard to be "recognized" within the meaning of the general duty clause. Brennan v. Occupational Safety and Health Review Commission (Vy Lactos), 494 F. 2d 460,

464 (C.A. 8, 1974); see also Secretary v. Pratt and Whitney Aircraft, Docket Nos. 130 & 510, 1974-75, OSHD ¶19,287 (1975).

Respondent's additional argument that the allegations herein were mere "housekeeping" complaints abhors the record. Two to three barrels of oil per day translates into a substantial volume in a small area.

In this case the issues concerning abatement and feasibility are not in issue. The citation asserted, in part, that respondent:

> Install a sump and system that will adequately contain, remove effectively, and prevent flooding from potential and future leaks and spills.

Respondent's witnesses indicated the problems were solved; that they anticipated no future difficulties at the fluid bed incinerator. Respondent's reliance on National Realty and Construction Company, Inc. v. Occupational Safety and Health Review Commission 489 F.2d 1957 (C.A., D.C. 1973) is accordingly misplaced.

Evaluations concerning civil penalties are to be made independently of complainant's proposals, Secretary v. Dreher Pickle Company, 2 OSHRC 497 (1973). The Commission has ruled that of the four statutory factors bearing on the appropriateness of the penalty the gravity of the violation should generally be accorded the greatest weight, 29 U.S.C., 666(i); Secretary v. Baltz Brothers Packing Company, 2 OSHRC 384 (1973). In the instant case the gravity is apparent. On the other hand respondent

spent $14,000 to redesign and reconstruct its sewer (Tr. 221). Respondent further attempted to solve the various problems it encountered at this location. On balance a civil penalty of $300 is appropriate.

No substantial issue of fact is presented by the record and the pleadings establish that respondent is an employer engaged in a business affecting commerce. Therefore, the undersigned enters the following:

ORDER

1. Citation 4 is affirmed.

2. The proposed civil penalty of $700 is vacated and a penalty of $300 is assessed in lieu thereof.

John J. Morris
Judge, OSHRC

OCCUPATIONAL SAFETY AND HEALTH REVIEW COMMISSION

---

RAYMOND J. DONOVAN, SECRETARY OF LABOR,

Complainant,

v.

OSHRC DOCKET
No. 76-2099

AMOCO OIL COMPANY,

Respondent.

---

COMPLAINANT'S MOTION TO WITHDRAW CITATION

Complainant, the Secretary of Labor, hereby moves to withdraw the citation at issue herein on the grounds that the evidence of record does not support a violation of section 5(a)(1) of the Act, as alleged.

The instant case is before the Commission upon direction of former Commissioner Moran. Respondent filed its brief with the Commission in March, 1977. On June 24, 1982 the Commission invited the Secretary to file a responsive brief. The Secretary has requested an extension of time in which to file the brief until August 16, 1982.

Complainant has advised the authorized representative of the affected employees of his intention to withdraw the citation and has explained his reasons for so doing. The authorized employee representative has informed Complainant that the hazardous condition on which the citation was predicated has been abated and has not recurred since 1976.

Complainant has also advised respondent of its intention to move for withdrawal of the citation. Amoco has indicated that it has no objection to this motion and that it will post this motion for inspection of any affected employees who may not be represented by the authorized employee representative at or near the place at which the alleged violation occurred for a period of at least ten (10) days.

WHEREFORE, Complainant respectfully requests that the Commission dismiss the citation in this case.

Respectfully submitted,

T. TIMOTHY RYAN, JR.
Solicitor of Labor

DECISION

Before: ROWLAND, Chairman; CLEARY and COTTINE, Commissioners

BY THE COMMISSION:

A decision of Review Commission Judge George W. Otto is before the Commission for review pursuant to section 12(j), 29 U.S.C. § 661(i), of the Occupational Safety and Health Act of 1970, 29 U.S.C. §§ 651-678 ("the Act"). Judge Otto vacated a citation which charged Respondent, K-Mart, with violating section 5(a)(1) of the Act, 29 U.S.C. § 654(a)(1),[1/] by failing adequately to protect employees from certain hazards arising out of the operation of a cardboard box compactor. For the reasons that follow we reverse the judge and affirm the citation.

The citation resulted from an accident at one of Respondent's stores involving a Bra-Con baler, a machine that compresses and

---

1/ Section 5(a)(1) provides:

SEC. 5. (a) Each employer--
(1) shall furnish to each of his employees employment and a place of employment which are free from recognized hazards that are causing or are likely to cause death or serious physical harm to his employees.

bales cardboard boxes.[2/] The baler is leased by Respondent from its owner, Radiographics, but it is operated by Respondent's employees. The baler is shaped like a vertically upright cabinet that is tall enough for a person to stand in when the ram is in its upper or lower position. Inside the superstructure are a horizontal ram which descends to compress the cardboard, and a vertical hydraulic cylinder which operates the ram. The ram pushes the cardboard down into the lower portion of the machine. In the front of the baler is a door which covers the lower portion of the baler. The open space above the door is covered by a safety gate which moves up and down with the ram. The safety gate is designed to protect employees from injury due to the downward movement of the ram. Thus, if an employee places a hand or arm in the space between the top of the door and the ram while the ram is coming down, the ram will automatically reverse its direction when the safety gate comes in contact with the employee.

Other safety features on the baler are the control panel, automatic cutoff of the motor, and a door limit switch. The control panel is located on the upper right hand side of the front of the baler. The top control is a disconnect lever which energizes the machine. The "bale eject" button determines the machine's function, i.e., compressing or baling, and the selector button determines the ram's cycle, i.e., up or down only or a full cycle starting in the up position. The bottom button turns the motor off or on, thereby activating the ram.

---

2/ The exact circumstances and cause of the accident in which an employee was crushed in the baler are unknown.

This button is pulled out to turn the machine on and pushed in to turn it off.

Normally, the motor cuts off automatically after the ram completes its intended movement (up or down or a single full cycle). However, an electrical malfunction can cause the motor to continue running after the ram has stopped moving, and such a malfunction occurred at least once in the year preceding the accident. The final safety feature, the door limit switch, stops the ram whenever the door is opened. With the door open, the ram will move only when an employee continues to hold the bottom button in the on position.

The baler performs two basic functions: compressing and baling. Any employee can compress cardboard boxes, but only stockroom personnel are authorized to perform the baling operation. The top three buttons or levers on the control panel are customarily left in the positions necessary to perform the compressing operation, so an employee need only throw the box to be compressed through the opening between the top of the door and the bottom of the safety gate and then pull out the bottom on-off button. When this is done, the ram automatically goes through a single cycle, thereby compressing the box, and the motor automatically shuts off. The process is repeated until all boxes have been compressed.

To perform the baling operation, a stockroom employee first brings the ram down to hold the cardboard in place. The employee then opens the door and places five wires around the cardboard. These wires are inserted through slots in the back of the machine and tied together at the front of the baler. The machine is then activated to eject the bale.

The record establishes that it is never necessary for Respondent's employees to go into the baler to perform the compressing and baling operations. Frequently, cardboard becomes lodged between the ram and the sides or back of the superstructure. This cardboard will not interfere with the compressing operation and therefore there is no need to remove the cardboard during this operation. However, the cardboard does interfere with the baling operation because it precludes employees from inserting wires through the baler. Accordingly, employees have been provided sharp instruments that they use to poke holes in the cardboard so that the wires can be inserted.

Although it was not necessary for them to do so, several of Respondent's employees went into the baler to dislodge cardboard. Kenneth Pflugradt, the injured employee, testified that he climbed into the baler to remove cardboard approximately once a night for the two months preceding his accident. He further testified that he had observed two other stockroom employees, including his supervisor, climb onto the ram during the baling operation in order to dislodge cardboard. To enter the baler, employees climbed the ledges on the outside of the door while the door was closed, thus circumventing the door limit switch. In addition, Kelly Gratz, who was also a stockroom employee, testified that he had seen employees "a lot [of times]" lift up the safety gate and reach across the ram in order to pull out cardboard. Gratz conceded that he had done this in conjunction with compressing, as well as baling, because "some people, if they saw that boxes were stuck in there, would just leave their boxes and not crush them."

Several employees testified concerning the instructions they had received in operating the baler. When the baler was first leased and installed, which was over two years prior to the incident in question, the store manager gave a demonstration and instructions to all employees. The manager issued a strict prohibition against any employee at any time placing a hand, an arm or any part of the body into the baler and further stated that any employee who violated this rule would be terminated.

Those employees who began working for Respondent after this initial training session were taught how to operate the baler by their supervisors or by stockroom employees. The nature and extent of this later training varied. Some employees received the same instructions from their supervisors or stockroom employees that had originally been given by the store manager. On the other hand, Pflugradt, who was trained by his stockroom supervisor, testified that the only safety instruction he received was to keep his hands out of the baler when the ram was moving. He further testified, without contradiction in this record, that he climbed on top of the ram to remove cardboard because he had seen his supervisor do so.

Respondent's employees did not service or repair the baler. This work was performed by Hiram Anderson, an employee of Radiographics, the lessor of the baler. Anderson, who serviced 114 balers on a regularly scheduled basis, testified that he routinely instructed his customers that employees should never enter the baler to pull out cardboard. When asked why this instruction was given, Anderson replied:

> I think it is just like there are so many possibilities sometimes, acts of God, I don't know what you call it, things that enter your mind when you get involved with machinery that

> I just, like, we just don't want the man in the machine. The platen is up there, there is a lot of weight up there, there is no reason for him to take any chance.

Anderson testified that he de-energized the baler by removing the fuses before he worked on it.

Judge Otto concluded that Respondent's employees were adequately trained in safe operation of the baler and vacated the citation. Commissioner Cottine directed the Secretary's petition for review in which the Secretary argues that Respondent's safety program did not free the workplace of the hazard. Respondent argues that its safety program was adequate, that the baler's mechanical safety features effectively protected employees from the hazard during normal operations, and that injury could occur only as the result of idiosyncratic employee misconduct.

In order to establish a section 5(a)(1) violation, the Secretary must prove: (1) the employer failed to render its workplace free of a hazard, (2) the hazard was recognized either by the cited employer or generally within the employer's industry, (3) the hazard was causing or was likely to cause death or serious physical harm, and (4) there was a feasible means by which the employer could have eliminated or materially reduced the hazard. E.g., Jones & Laughlin Steel Corporation, 82 OSAHRC _____, 10 BNA OSHC 1778, 1982 CCH OSHD ¶ 26,128 (No. 76-2636, 1982). We conclude for the reasons that follow that the Secretary has met his burden of proving each of these elements in this case.

The hazard at issue is the possibility of a crushing injury due to movement of the ram during routine operation of the baler. A recognized hazard is a condition or practice

in a workplace that is known to be hazardous by either the industry in general or the employer in particular. Respondent's recognition of the hazard is evidenced by the instructions that the store manager gave shortly after the baler was first installed prohibiting any employee from placing any part of the body within the baler at any time. In addition, Respondent knew that the baler was equipped with safety features, particularly the safety gate, that were specifically designed to prevent crushing injuries caused by the ram. See, e.g., Ted Wilkerson Inc., 81 OSAHRC 70/D8, 9 BNA OSHC 2012, 2016, 1981 CCH OSHD ¶ 25,551 at p. 31,856 (No. 13390, 1981)(issuance of a work rule shows employer recognition of the hazard.) Moreover, in view of Anderson's extensive experience with Bra-Con balers, his repeated warning that operating employees should never go inside the baler, and the reasons underlying his warnings, clearly show the hazard was recognized by the industry.

Respondent argues in effect that the baler's safety features and the training and instructions it provided employees rendered the workplace "free" of the hazard posed by movement of the ram. We do not agree. An employer's duty under section 5(a)(1) is to free its workplace of recognized hazards that are likely to cause death or serious harm. When elimination of a hazard depends on employee compliance with safety rules, the employer must take all feasible steps to assure that employees comply with the rules. Feasible steps for assuring employee observance of safety procedures include work rules designed to prevent the violation at issue,

effective communication of those rules to employees, employer efforts to discover violations, and employer enforcement of the rules when violations are discovered. See General Dynamics Corp., Quincy Shipbuilding Division v. OSHRC, 599 F.2d 453, 458 (1st Cir. 1979); National Realty and Construction Co. v. OSHRC, 489 F.2d 1257 (DC Cir. 1973); Little Beaver Creek Ranches, Inc., 1982 OSAHRC _____, 10 BNA OSHC 1806, 1982 CCH OSHD ¶ 26,125 (No. 77-2096, 1982); Jones & Laughlin Steel Corp., supra; Western Massachusetts Electric Co., 81 OSAHRC 63/B13, 9 BNA OSHC 1940, 1981 CCH OSHD ¶ 25,470 (No. 76-1174, 1981).

We reject Respondent's argument that the baler's safety features and the training and instructions Respondent provided employees rendered the workplace "free" of the hazard posed by movement of the ram during routine operation. Although the evidence shows that the baler is safe when employees are operating it properly and there is no electrical malfunction, the record also establishes that on several occasions employees have operated the baler improperly and electrical malfunctions have occurred that pose a danger to those employees. Consequently, the baler's safety features do not eliminate the hazard. For example, the safety gate provides effective protection against a crushing hazard to an employee who stands at the control panel and operates the baler, but it cannot provide protection to an employee who circumvents this safeguard by lifting the safety gate to reach over the ram or who climbs over the door and safety gate onto the ram. Respondent's employees engaged in both of these activities.

These examples establish that it was necessary for Respondent to supplement the machine's physical safeguards with adequate employee training and safety instructions in order to satisfy its obligation under section 5(a)(1).[3/] Respondent's safety program was not, however, adequate. Respondent attempted to establish an effective work rule when Respondent's store manager instructed all employees that they should never place a part of their bodies into the baler. However, at the time of Pflugradt's accident, it had been over two years since the training session when that instruction was given. There is no evidence that employees who received their training at this initial session were ever reminded of this work rule. Moreover, employees who were taught how to operate the baler after the initial session were not instructed to keep out of the baler at all times. The injured employee, Pflugradt, for example, testified without contradiction that he was instructed only to avoid entering the baler when the ram was actually moving.

In addition, Respondent failed to take adequate steps to effectively enforce its work rule, including measures to discover violations of the rule. The number of incidents of employees--including supervisory employees--entering the baler demonstrates that Respondent did not effectively monitor employee compliance or discipline employee non-compliance. As the United States Court of Appeals for the District of Columbia Circuit noted in National Realty & Construction Co. v. OSHRC, 489 F.2d at 1267

---

3/ The Secretary has not suggested any method of machine guarding in addition to those already in use on the baler as a means of protecting Respondent's employees.

n.38, the fact that a supervisor feels free to breach a company safety policy is strong evidence that implementation of that policy is lax. The hazard in this case could have been materially reduced if Respondent had adequately trained and instructed its employees.[4/]

Based on our conclusion that Respondent failed to take the steps necessary to assure that employees operated the baler safely, we reject Respondent's contention that the Secretary is seeking to impose strict liability. Because employees frequently entered the baler and because the machine has previously had electrical malfunctions, we cannot agree with Respondent that injury could only occur as the result of idiosyncratic misconduct or "freakish . . . circumstances."

The Secretary satisfied his burden of proving that the hazard was causing or likely to cause death or serious physical harm by introducing evidence concerning the pressure exerted by the ram. The Secretary's evidence also shows the existence of "pinch points" where an employee could be crushed due to movement of the ram or the safety gate, and hospitalization and extensive lost time could result.

---

4/ Because the Secretary met his burden of proving that Respondent failed to take adequate measures to establish and communicate an effective work rule, Chairman Rowland does not find it necessary to decide whether an employer may properly be required to enforce work rules which have been communicated to employees. For a discussion of the question whether an employer should be required to do anything more than give instructions to employees regarding proper safety procedures, see General Electric Co. v. OSHRC, 540 F.2d 67, 69 (2d Cir. 1976); Borton, Inc., 82 OSAHRC 17/E13, 10 BNA OSHC 1462, 1982 CCH OSHD ¶ 25,983 (No. 77-2115, 1982)(dissenting opinion), petition for review docketed, No. 82-1661 (10th Cir., May 26, 1982).

Finally, the Secretary established the feasibility of materially reducing the hazard by providing adequate training and instructions to employees in safe operation of the baler.[5/]

Accordingly, we find that a violation of the general duty clause has been established and reverse the judge.

SO ORDERED.

FOR THE COMMISSION

Ray H. Darling, Jr.
Executive Secretary

DATED: AUG 31 1982

---

5/ We vacate the allegation that Respondent violated section 5(a)(1) by failing to establish procedures for locking out the source of power at the main disconnect switch. We conclude that the Secretary failed to prove that establishing lockout procedures was a precaution that would have eliminated or materially reduced the hazard at issue. The purpose of a lockout device in this context would be to protect an employee working inside the baler from the possibility that a second employee might activate the ram without knowing that he was thereby endangering the first employee. However, the record establishes that there was no need for Respondent's employees to go inside the baler. We note that the baler was serviced by Anderson, the Radiographics employee, who locked out the baler by removing the fuse. Hence, lockout procedures are unnecessary if effective work rules preclude entry into the baler.

OCCUPATIONAL SAFETY AND HEALTH REVIEW COMMISSION

| | | |
|---|---|---|
| SECRETARY OF LABOR, | : | |
| Complainant | : | OSHRC |
| v. | : | Docket No. 77-270 |
| K-MART, | : | |
| Respondent. | : | |

Appearances:

Donald H. Segel, Esq., for Complainant

Truman Q. McNulty, Esq., for Respondent.

Judge George W. Otto

This proceeding under the Occupational Safety and Health Act of 1970, 29 U.S.C. 651 et seq., (Act) arose pursuant to notice by K-Mart, a corporation, contesting a citation issued by the Secretary of Labor (Secretary) by authority of 29 U.S.C. 658(a). The citation charges a serious violation of 29 U.S.C. 654(a)(1), specifies immediate abatement and proposes a $600 penalty.

Respondent K-Mart alleges the cited statute is unconstitutional, that the inspection was made without proper authority, denies jurisdiction, objects to amendment of the citation, denies violation and disputes the abatement time and proposed penalty.

Determination of constitutionality of the Act is not within Commission authority.[1/] No court has found 29 U.S.C. 654(a)(1) invalid. Respondent has presented nothing to impair the validity of the inspection. The employer's personnel manager telephoned the OSHA Milwaukee, Wisconsin office on November 23, 1976 and reported injury to an employee. An OSHA compliance officer commenced inspection and investigation on November 23 and the employer did not refuse access to the workplace. The inspection was confined to the area involved in the reported injury. The compliance officer presented appropriate credentials and there is no indication that he failed to inspect and investigate during regular working hours and at other reasonable times, and within reasonable limits and in a reasonable manner. In Stephenson Enterprises, Inc., v. Marshall, 5th Cir. 1978, No. 76-4163, inspection was declared valid, the employer having consented to examination of the plant facilities; the court distinguished Marshall v. Barlow's Inc., 98, S.Ct. 1816, 56 L.Ed.2d 305 (1978), wherein the Supreme Court held that provisions of the Act violate the fourth amendment to the extent that they purport to authorize warrantless inspections over the refusal of an employer.

K-Mart has not been prejudiced by the complaint amendment of the citation description of alleged violation. A citation does not freeze the legal theory of a case. The Act does not expressly provide for the issuance of a complaint, following an employer's contest of citation. However, Commission Rule 33(a)(3), codified as 29 C.F.R. 2200.33(a)(3), provides that where the Secretary seeks in his complaint to amend his citation or proposed penalty, he shall set forth the reasons for amendment and shall state with particularity the change sought. Complaint paragraph IV(a) states with particularity the change sought and complaint paragraph V states the reason for amendment.[2/]

## THE ISSUES

1. Violation of 29 U.S.C. 654(a)(1).

2. Abatement time.

3. Assessment of penalty.

## FINDINGS OF FACT

1. Respondent K-Mart is an employer engaged in a business affecting commerce, with employees in a workplace at 4601 South 27th Street, Greenfield, Wisconsin.

2. On November 22, 1976 an employee was injured on a Bra-Con Baler, Series 800. The cause and the circumstances of the injury are unknown.[3/]

3. The baler was owned by Radiographics, leased to K-Mart and installed in August 1974. Since installation it has been serviced and repaired by a Radiographic employee; it has not been serviced or repaired by any K-Mart employee. Since installation it has been used by K-Mart for baling cardboard. Employees of all K-Mart departments have been authorized to dispose cardboard into the baler. Only K-Mart assistant managers and stockroom employees have been authorized to place wires or bands around the compressed cardboard and operate the baler to eject the bale.[4/]

4. The baler was maintained by a Radiographics employee. The baler was not maintained by any K-Mart employee. Removal of cardboard from the platen-backwall space or from the top is not a baler maintenance function but is a bale production element.[5/]

5. K-Mart employees were instructed in the performance of their duties associated with the use of the baler.[6/]

6. Respondent did not fail to train and instruct employees on the safe use and operation of the baler.

7. Respondent did not add padlocks or other devices to the baler, after installation.[7/]

8. The providing of lockout procedures, such as padlocks, at the source of power at the main disconnect switch prior to maintenance of the Bra-Con Baler, is not essential to furnish to respondent employees employment and a place of employment free from recognized hazards that are causing or are likely to cause death or serious physical harm.[8/]

9. There was no recognized hazard causing or likely to cause death or serious physical harm to K-Mart employees who disposed of cardboard by placing it in the baler or who worked as stockroom employees in tying, banding and ejecting bales from the baler.

OPINION

To establish a violation of the general duty clause, the Secretary must prove (1) that the employer failed to render its workplace free of a hazard which was (2) recognized and (3) causing or likely to cause death or serious physical harm. U. S. Pipe and Foundry Company, #11739, 1978.

The Secretary does not contend the baler operation and use is unsafe during normal, expected performance, and in the absence of malfunction. If an employee believes it advantageous to compress the cardboard accumulation, to permit additional cardboard in the bale formation, the employee is authorized to pull the lowest button

on the control panel to activate the ram. The control panel is not detached from the baler, is part of the machine and is located on the face to the immediate right and above the top of the baler door. The door height is four feet eleven inches from the floor and the disposal opening above it is two feet four inches (the dimensions in R-1, p.4 figure 2 are deemed accurate for this baler). The main disconnect switch on the control panel contains two holes which could be used to attach a padlock. In vertical alignment below the switch are three black buttons. The top black button is used in ejecting the completed bale from the baler. The middle black button permits selection of the ram movement, either automatic or manual up or manual down. The bottom button is pulled to activate the ram (T. 103 - 108, 262, 263, 411 - 415, 447 - 454, 3H: 14 - 19, 96, 97, C2 - 3 - 4 - 7 - 8 - 9, R-1 p. 2, 5). A safety gate above the door moves down and up with the ram movement. The disposal interior is four feet eight inches wide and the exterior dimension front to back is three feet seven inches. There is three-fourths inch clearance between the interior walls and the platen; cardboard lodges within this space and gets on top and at times interferes with the insertion of wires or bands. Employees responsible for attaching the wires or bands around the compressed cardboard are provided with a sharp tool to punch holes in the cardboard between the wall and the platen if there is such obstruction but this is not always effective. Holes are punched from the back with the employee outside the baler. According to a former stockroom employee, punching the hole

with the tool worked about 95% of the time and in 5% the ram was raised, wire fed through and the ram lowered (T.426). The employees were instructed that at no time were they to put hands, arms, parts of the body into the machine, (that) anyone violating this procedure would be terminated (T.379, 380). However, some stockroom employees did move or reach into the baler to remove cardboard; this was done without the employer's knowledge or approval. Without doubt there was a problem at times due to cardboard interfering with the final baling operation within the machine but this problem did not constitute a recognized hazard.

The Radiographic employee who installed, serviced, maintained and repaired this baler did similar work, about monthly, on a total of 112 balers and was familiar with other balers. He has never seen a padlock on balers and there is no testimony or other record that padlocks are used on this type of baler operation. The Secretary introduced a data sheet prepared by the National Safety Council (C-10), entitled "Methods of Locking Out Electrical Switches." This document is an informational article discussing various techniques for accomplishing the locking function. Lockouts are recommended where the disconnect is remote from the machine or where the machine is so large that the employee at the disconnect could not possibly see all parts of the machine, according to respondent's expert witness. In the instant case the control panel containing the disconnect switch is attached to the machine; an employee using the control panel should have no difficulty in seeing the interior and other parts of the baler, considering its size. The duties performed by K-Mart employees did not require a power disconnect to provide a more safe employment and place of employment. The Radiographic employee used a

fuse puller and removed the fuses before performing maintenance or repair work but the baling operations performed by K-Mart employees are unrelated to the maintenance and repair activity making advisable removal of fuses.

## CONCLUSIONS OF LAW

1. The Commission has jurisdiction to hear, determine and make final disposition of this proceeding.

2. Respondent did not fail to furnish to each of its employees employment and a place of employment which are free from recognized hazards that are causing or are likely to cause death or serious physical harm to its employees.

## ORDER

The citation issued December 27, 1976 is hereby vacated.

George W. Otto
Judge, OSHRC

Dated: October 23, 1978

## FOOTNOTES

(The first and second hearings are recorded on transcript pages 1 -497 (T.1-497).
The third hearing is recorded on transcript pages 1-118 (3H: 1-118).

1. Hullenkremer Construction Co.,Inc., 78/19/C8, 6 BNA OSHC 1469, CCH OSHD para. 22,568 (No. 15370, 1978).

2. Citation description: (a) Each employee required to operate the Bra-Con Baler, Model 800 located in the stockroom, was not instructed in the recognition and avoidance of unsafe conditions. (b) Positive means, such as padlocks, were not provided for locking out the source of power at the main disconnect switch prior to maintenance of the Bra-Con Baler, Model 800.

   Complaint description: Respondent's employees operating and working on the Bra-Con Baler, Model 800, located in the stockroom were subjected to being crushed by the Bra-Con Baler as a result of the employer's failure to train and instruct employees on its safe use and operation; (b) respondent failed to provide lockout procedures, such as padlocks, at the source of power at the main disconnect switch prior to maintenance of the Bra-Con Baler,Model 800.

OCCUPATIONAL SAFETY AND HEALTH REVIEW COMMISSION

| | |
|---|---|
| SECRETARY OF LABOR,<br><br>Complainant,<br><br>v.<br><br>BECHTEL POWER CORPORATION,<br><br>Respondent. | OSHRC Docket No. 77-3222 |

DECISION

Before: ROWLAND, Chairman; CLEARY and COTTINE, Commissioners.

BY THE COMMISSION:

A decision of Administrative Law Judge Henry K. Osterman is before the Commission pursuant to section 12(j), 29 U.S.C. § 661(i), of the Occupational Safety and Health Act of 1970, 29 U.S.C. §§ 651-678 ("the Act"). Judge Osterman vacated a citation issued by the Secretary of Labor ("the Secretary") to Respondent, Bechtel Power Corporation ("Bechtel"), following an employee's fatal fall from a scaffold and the Secretary's subsequent inspection of the accident site in Pottstown, Pennsylvania, where Bechtel was engaged in constructing a nuclear power plant. The Secretary's citation alleged that Bechtel had failed to comply with the standards at 29 C.F.R. § 1926.451(e)(5) 1/

---

1/ The standard at 29 C.F.R. § 1926.451(e)(5) provides:

> § 1926.451 Scaffolding.
>
> * * *
>
> (e) Manually propelled mobile scaffolds.
>
> * * *
>
> (5) A ladder or stairway shall be provided for proper access and exit and shall be affixed or built into the scaffold and so located that when in use it will not have a tendency to tip the scaffold. A landing platform must be provided at intervals not to exceed 35 feet.

The citation alleged:

> Proper and safe access was not provided to employees working on top of the 24 foot high mobile scaffold in the Turbine Enclosure Unit #1 in that the positioning of the ladder below an overhead beam required the employees to reach out and up to gain access to the scaffold platform. This resulted in an accident to an employee on 8/24/77.

and 29 C.F.R § 1926.451(e)(8) [2/] and proposed a penalty of $900 for these alleged violations, which were characterized as serious. [3/] The judge vacated the citation based on his conclusion that the Secretary had failed to establish Bechtel's knowledge of the allegedly violative conditions. The Secretary petitioned for review of the judge's disposition of both items and Commissioner Cleary directed review on the issues raised by the petition.

For the reasons stated below, the Commission concludes that the Secretary established noncompliance with both cited standards and that Bechtel's noncompliance with section 1926.451(e)(5) was a serious violation of the Act, as alleged. However, the Commission also concludes that Respondent's failure to comply with section 1926.451(e)(8) was a de minimis violation of the Act and therefore neither a penalty nor an abatement requirement for that violation is warranted.

I

The fatal incident giving rise to the citation on review involved a Bechtel pipe welder, Zaleski, who was performing an assigned task on top of a scaffold

---

2/ The standard at 29 C.F.R. § 1926.451(e)(8) provides:

> § 1926.451 Scaffolding.
>
> * * *
>
> (e) Manually propelled mobile scaffolds.
>
> * * *
>
> (8) Scaffolds in use by any persons shall rest upon a suitable footing and shall stand plumb. The casters or wheels shall be locked to prevent any movement.

The citation alleged:

> The casters or wheels on manually propelled mobile scaffold were not locked to prevent movement:
>
> a) Turbine Enclosure Unit #1--three unlocked wheels on 5x7 safeway scaffold.

3/ The Secretary subsequently moved to amend his citation and complaint to charge a violation of section 5(a)(1), 29 U.S.C. § 654(a)(1), of the Act as an alternative to the alleged failure to comply with the standard at § 1926.451(e)(5). For the reasons developed infra, the Commission concludes that the cited standard is applicable here. It is well established that the applicability of a standard precludes citation to the general duty clause. Brisk Waterproofing Co., Inc., 73 OSAHRC 30/E1, 1 BNA OSHC 1263, 1973-74 CCH OSHD ¶ 16,345 (No. 1046, 1973). Accordingly, the Commission does not consider the parties' arguments on review concerning the alternative allegation under the general duty clause.

(scaffold "O") that was located alongside a wall inside the plant under construction. For approximately one week, Zaleski and another welder, Kertes, had been using a ladder affixed to an adjacent scaffold (scaffold "X") whenever they needed to gain access to scaffold "O", because the ladder on "O" was too short--by 6 or 8 feet--to reach the scaffold platform. 4/ Scaffold "X" was a single-tower, mobile scaffold on four wheels, with a 5x7-foot platform that was 24 feet above the ground. It was situated in such a manner that the edge of the platform to which its ladder was attached was located beneath a horizontal beam passing overhead. As described later by Kertes at the hearing, Zaleski climbed up the scaffold ladder and, as he neared the platform level, he reached for the top guardrail. When Zaleski grabbed the rail, it tore loose from the scaffold. 5/ Zaleski fell backward from the scaffold and landed on the ground. He never regained consciousness.

At the hearing before Judge Osterman, the Secretary's compliance officer testified that, as a result of the presence of the overhead beam, one was prevented from going up to a standing position and stepping off the ladder at the same level as the scaffold platform: "It would force him to be holding onto the ladder with one arm and one leg and he would have to whip his leg up onto the platform . . . approximately two to three feet." The compliance officer, who climbed the scaffold himself during his inspection, stated that the beam impeded

---

4/ The record also indicates that two other ladders would have afforded access to scaffold "O". Nevertheless, based on one of the exhibits introduced by Bechtel, it does not appear that either provided as direct access to Kertes and Zaleski's work station. Moreover, Hagan, one of Bechtel's safety representatives, testified that one of these ladders also appeared to be too short.

5/ Much of the record is devoted to the possible unauthorized modification of the guardrails on the scaffold--Kertes denied that he had tampered with the guardrail--and to the failure of the employees to report this unsafe condition to Bechtel supervisors, as required by company workrules. This evidence formed part of the basis of Bechtel's unpreventable employee misconduct defense. Nevertheless, we conclude that this evidence (and Bechtel's arguments in support of this aspect of its unpreventable employee misconduct defense) need not be considered further, because the basis of the alleged violation is the positioning of the scaffold ladder, not the condition of the perimeter guarding on the scaffold platform.

the progression of the climber up the ladder. The union steward, who followed the compliance officer up the ladder during the inspection, also referred to the dangerous transition from the ladder to the platform--"Well, the left hand, you had to grab up higher and then swing actually your body into the scaffolding to get over to the scaffolding . . . You could not step on there, no."--and cited the overhead beam as a cause of the access problem. Kertes recalled that the scaffold platform was so close to the ceiling that one could not stand up. In describing the transition from the ladder, Kertes stated, "You had your left hand on the ladder, left foot at a ladder rung, put your knee on the scaffold and just crawled in." Thus, an employee, instead of alighting from the ladder in a standing position and then bending over to enter the platform between the top and mid-rails, would necessarily have to dismount the ladder from below the level of the platform and then grasp a guardrail and pull himself up to the platform and through the guardrails.

The record indicates that, according to company policy, the carpenter foreman was responsible for inspecting scaffolds when they were erected, modified or moved. 6/ Scaffold "X" was "reworked" by three carpenters under the direction of the carpenter foreman two days before the accident and the record indicates that the scaffold was located beneath the beam at that time. The carpenter foreman testified that he probably passed by the scaffold many times in the period between the "rework" and the accident, but he could not recall if he had observed the entire scaffold. The record also reveals that some employees at the worksite complained to their union steward about unsafe access to scaffolds several weeks prior to the incident in question. There is no evidence that any of these complaints concerned the specific scaffold described in the citation, although the complaints involved scaffolds in the same general area.

---

6/ Bechtel's "Safe Practices" booklet provides:

> Each scaffold must be inspected and approved by responsible supervisory personnel prior to initial use and after alteration or moving.

II

A

In his decision, Judge Osterman found that the beam's location directly above the scaffold made it impossible to step directly from the ladder to the scaffold, thereby necessitating that Zaleski haul himself up a distance of approximately 2 feet from a rung on the ladder to the platform of the scaffold. Without explicitly holding that section 1926.451(e)(5) was applicable here, the judge assumed that the positioning of the ladder on the scaffold and its relationship to the platform violated the standard because "proper access and exit" to and from the platform was not provided. Nevertheless, the judge found that the Secretary had failed to show that Respondent had prior knowledge, either actual or constructive, of a potential hazard to its employees. On this basis, the judge vacated this item in the citation.

B

On review, Bechtel argues that section 1926.451(e)(5) simply requires that the employer furnish a stairway or ladder; the standard in its view does not address the issue of the positioning of the mobile scaffold to avoid overhead obstructions. Contrary to Judge Osterman's analysis, Bechtel insists that the words "for proper access and exit" are mere surplusage, for they merely explain why the drafters required a ladder on a mobile scaffold. Bechtel contends that, if these words are to be interpreted by the Secretary to mean something other than simply locating the ladder so that it will not have a tendency to tip the scaffold when it is in use, then the standard is vague and unenforceable.

Citing Perini Corporation, 77 OSAHRC 65/A2, 5 BNA OSHC 1343, 1977-78 CCH OSHD ¶ 21,790 (No. 12589, 1977), Bechtel also asserts that the Commission has held that employers may rely on the standards for ladders contained in Subpart L as prescribing the exclusive requirements for the types of ladders to be used on mobile scaffolds. It argues in effect that a violation of section 1926.451(e)(5) cannot be sustained in the absence of a showing of noncompliance with a ladder

specification standard. Thus, Bechtel states that its obligation under the standards was to provide a ladder which was affixed or built into the scaffold and so located that, when in use, it would not have a tendency to tip the scaffold, and which had side rails extending at least 36 inches above the platform landing. Bechtel declares that it satisfied all of these requirements and, hence, there was no violation.

Alternatively, Bechtel contends that, even under the Secretary's interpretation of the standard, the Secretary did not sustain his burden of proving that the means of access provided was improper. In effect it argues that the employees obtained access in the customary manner by climbing through the guardrails and that the overhead beam did not obstruct this access.

Bechtel further asserts that it rebutted any presumption of employer knowledge of the alleged violative condition by introducing evidence that the use of the scaffold in question by Kertes and Zaleski was an unknown, isolated incident of employee nonconformance with Bechtel's safety program. Bechtel insists that there is no evidence either that it required any employee to use the mobile scaffold at that location at the time of the alleged violation or that it had knowledge of the employees' use--which was not foreseeable--of the scaffold, in noncompliance with Bechtel's work rules.

C

At the outset, the Commission must determine whether section 1926.451(e)(5) includes a requirement that the means of access provided be safe. The Commission concludes that the standard contains this requirement. 7/ The recent case of H.E. Wiese, Inc., 82 OSAHRC 18/A2, 10 BNA OSHC 1499, 1982 CCH OSHD ¶ 25,985 (Nos. 78-204 & 78-205, 1982), presented a similar interpretative issue involving a different

---

7/ Commissioners Cleary and Cottine join in this subpart (II C) of the Commission's decision. Chairman Rowland's views are stated in his separate opinion.

but related standard governing scaffolding, section 1926.451(a)(13). 8/ There, we rejected the employer's argument that compliance with the standard was achieved simply by providing a ladder even though the ladder did not provide complete access across a 2-foot gap to the scaffold in question. We noted that the plain meaning of the standard is that safe access must be provided at all points between the lower elevation and the scaffold. In addition, we rejected the employer's argument that the cited standard was unenforceably vague, concluding that the term "safe access", as used in the standard, was not unclear, and also rejected the contention that the Secretary must prove noncompliance with a ladder specification standard in order to prove a violation of section 1926.451(a)(13).

We conclude that, consistent with the holdings of H.E. Weise, Bechtel's contentions concerning the proper interpretation of section 1926.451(e)(5) must be rejected. The requirement of section 1926.451(e)(5) to provide "proper access" imposes the same obligation as that contained in section 1926.451(a)(13) to provide "safe access." Therefore, we conclude that the objective of section 1926.451(e)(5) is to provide employees with safe access—"proper access and exit"—to mobile scaffolds by means of a ladder or stairway. This objective cannot be achieved if, as Bechtel argues, an employer is required merely to provide a ladder that may or may not afford "proper access and exit." Cf. H.E. Wiese, Inc., supra. To read this standard narrowly to require an employer simply to provide a ladder or stairway, but not to require that the employer ensures that the ladder is so positioned as to provide "proper access and exit", would (1) improperly read that phrase out of context and in a manner contrary

---

8/ The standard at 29 C.F.R. § 1926.451(a)(13) provides:

§ 1926.451 Scaffolding.

(a) General requirements.

* * *

(13) An access ladder or equivalent safe access shall be provided.

to the purposes of the Act and (2) improperly shift responsibility for occupational safety and health from the employer to the employee, cf. Borton, Inc., 82 OSAHRC 17/E13, 10 BNA OSHC 1462, 1982 CCH OSHD ¶ 25,983 (No. 77-2115, 1982) (under section 1926.451(a)(13), an employer must not only provide but also ensure use of an "access ladder or equivalent safe access" when employees seek to gain access to scaffolding). As in H.E. Wiese, we also reject Bechtel's argument that the cited standard is unenforceably vague, for a ladder or stairway that poses hazardous access to the scaffold platform plainly does not provide "proper access and exit." Moreover, we conclude that Bechtel's reliance on Perini Corp. is misplaced because the issue there was whether the means of access provided by the employer was a "ladder" within the meaning of the cited standard, not whether it provided "proper access and exit." Perini Corp. interprets section 1926.451(e)(5) as requiring a ladder to meet certain minimum specifications, for example, distances between rungs. However, for the reasons discussed, section 1926.451(e)(5) also requires an employer to provide a ladder which is positioned to afford "proper access and exit."

The next issue for determination is whether Bechtel complied with its obligation under the cited standard. The Secretary presented two witnesses, the compliance officer and the shop steward, who testified that the presence of the overhead beam directly above the ladder prevented employees from stepping off the ladder onto the platform at the level of the platform and, thus, subjected employees to the hazard of falling from the platform to the ground 24 feet below. Both witnesses testified that employees had to swing their legs up to reach the platform. This testimony is substantiated by the photographic evidence, which demonstrates that the vertical distance between the overhead beam and the scaffold platform was clearly less than the width of the platform itself, which Bechtel concedes to be 5 feet. In addition, the Secretary's contention that the beam obstructed access is further corroborated by Kertes' testimony that he could not stand up on the scaffold's platform. Judge Osterman found

that Zaleski could not step directly from the ladder to the floor of the platform. We conclude that this finding is supported by a preponderance of the evidence as set forth above and, based on this finding, we further conclude that the ladder's positioning beneath the beam did not afford the "proper access and exit" which the standard requires.

Respondent's argument to the contrary is unpersuasive, for although Bechtel introduced testimony that the customary practice at construction worksites was to climb through the guardrails in order to gain access to a scaffold platform, the record does not indicate that customary practice also embraced swinging one's leg up some 2 feet in the air and pulling oneself up to the scaffold platform so that one could then climb through the guardrails. It is not the practice of climbing through the guardrails that is at issue in this case, but rather it is the necessity of pulling oneself up a distance of approximately 2 feet to the level of the platform before one can climb through the guardrails.

The evidence establishes that Respondent failed to comply with the requirements of the cited standard. In addition, it is undisputed that employees had access to the hazard. In order to prove that an employer committed a violation, the Secretary must also show that the employer knew or, in the exercise of reasonable diligence, could have known of the violative condition. Prestressed Systems, Inc., 81 OSAHRC 43/D5, 9 BNA OSHC 1864, 1981 CCH OSHD ¶ 25,358 (No. 16147, 1981). The record does not reflect actual knowledge by Bechtel of the violative condition involving the scaffold. However, we conclude that there is ample evidence to support a finding of failure to exercise reasonable diligence. First, Kertes and Zaleski openly and regularly climbed up and down the scaffold in question during the week prior to the accident. Second, the carpenter foreman—who was responsible for inspecting a scaffold after it had been moved or altered, e.g., after it was "reworked" two days before the accident—admitted that he had passed the scaffold many times in the period between this reworking and the accident. We note Bechtel's evident failure to inspect the scaffold, as

its own safety manual requires. It is well-settled that an employer must make a reasonable effort to anticipate the particular hazards to which its employees may be exposed in the course of their scheduled work. Automatic Sprinkler Corp. of America, 80 OSAHRC 47/E4, 8 BNA OSHC 1384, 1980 CCH OSHD ¶ 24,495 (No. 76-5089, 1980). Here, the record indicates that the scaffold had been in the same position for about one week, yet no corrective action was taken regarding the positioning of the ladder. Finally, Respondent was specifically alerted to similar problems involving safe access to nearby scaffolds several weeks before the fatal accident. Thus, we conclude that the Secretary established that Bechtel could, with the exercise of reasonable diligence, have known of the violative condition involving failure to afford proper access and exit as required by section 1926.451(e)(5) and, therefore, we reverse the judge's finding that Bechtel lacked actual or constructive knowledge.

Bechtel raises the affirmative defense of unpreventable employee misconduct, asserting that the two employees should not have been using the scaffold in question as access to their work station on an adjacent scaffold and that they failed to report the dangerous condition to Bechtel. The Commission has held that it will sustain the unpreventable employee misconduct defense only if an employer demonstrates that an employee's conduct was a departure from a uniformly and effectively communicated and enforced work rule. H.B. Zachry Co., 80 OSAHRC 9/D8, 7 BNA OSHC 2202, 1980 CCH OSHD ¶ 24,196 (No. 76-1393, 1980), aff'd, 638 F.2d 812 (5th Cir. 1981). Bechtel's warning to report "any unsafe practice" or "any questions concerning safety in the use of scaffolds" is too general to be regarded as an effective work rule directed to this specific hazard. See J.K. Butler Builders, Inc., 77 OSAHRC 26/A2, 5 BNA OSHC 1075, 1977-78 CCH OSHD ¶ 21,585 (No. 12354, 1977) and cases cited. Bechtel did have a work rule which states "Do not take shortcuts. Use appropriate ladders, ramps, stairways, and paths." However, there is no persuasive evidence in the record that the ladder in question was not "appropriate" within the meaning of this work rule. Kertes

and Zaleski were performing an assigned task which required them to stand on scaffold "D". The record indicates that the ladder in question provided the most direct route, excluding other means of access that were in effect unusable, to the area where Kertes and Zaleski were assigned to work. See note 4 supra and accompanying text. The record indicates that Kertes and Zaleski openly, regularly, and frequently used this route to get to their job assignment. Yet there is no record evidence that they were ever told that the ladder was inappropriate or that they were ever instructed to use another means of access. Therefore, Bechtel did not demonstrate any departure from a work rule in this instance. Accordingly, we conclude that Bechtel failed to establish the unpreventable employee misconduct defense. We further conclude that Bechtel's noncompliance with section 1926.451(e)(5) constituted a serious violation of the Act as alleged by the Secretary, inasmuch as it exposed employees to a potential fall of 24 feet.

III

In his decision, Judge Osterman also vacated the citation item alleging noncompliance with section 1926.451(e)(8). Specifically, the citation alleged that three of the four wheels on the scaffold Zaleski fell from were unlocked. The judge simply stated that "there is no evidence that Respondent had prior knowledge, actual or constructive, that the wheels on certain portable scaffolds were unlocked and that employees were thus exposed to the hazard." On review, Bechtel supports the judge's reasoning and also offers alternative grounds for vacating this portion of the citation. It does not dispute that, on the day of the inspection, three of the four wheels were unlocked, but it charges that the Secretary presented no evidence that the wheels were unlocked at the time of the accident. Thus, Bechtel contends, the Secretary failed to prove employee exposure to noncomplying conditions. Moreover, even if some of the wheels were unlocked at the time of the accident, Bechtel continues, the record indicates through the testimony of a paramedic that the scaffold was immobile and, thus,

the citation must be vacated because there was no hazard. Finally, Bechtel states that its work rule required employees to lock the wheels when a scaffold is not in motion, yet Kertes testified that neither he nor Zaleski ever checked to see if the wheels were locked on those occasions when they ascended the scaffold. Therefore, Bechtel concludes it cannot be held liable for the employees' noncompliance with its safety rules.

The uncontradicted evidence establishes that three of four scaffold wheels were unlocked at the time of the inspection that occurred on the day following the accident. In view of the testimony that Bechtel immediately took steps to preserve the site in the condition it was in at the time of the accident, it is reasonable to conclude that the wheels had not been altered during the interval between the accident and the inspection. Accordingly, the Commission concludes that the Secretary established Bechtel's noncompliance with the cited standard. 9/

Nevertheless, we conclude that Bechtel's argument that its noncompliance did not create a hazard is supported by the record. We note that the Commission has found violations to be de minimis when the hazard involved bears such a negligible relationship to employee safety as to render inappropriate the imposition of an abatement requirement or the assessment of a penalty. Bethlehem Steel Corporation, 81 OSAHRC 86/A2, 9 BNA OSHC 2177, 1981 CCH OSHD ¶ 25,645 (No. 77-617, 1981), appeal docketed, No. 81-2802 (3rd Cir. Oct. 30, 1981). Here, the record establishes that, immediately following Zaleski's fall, a paramedic called to the scene was unable to move the scaffold "at all" while applying "[a]s much force as [he] was humanly capable [of applying] in a crouched position next to Mr. Zaleski." Kertes testified that the scaffold shook as he climbed but it was not alarming because it was normal for a scaffold to wobble a little. This assessment was echoed by the union steward. On this record, we

---

9/ Chairman Rowland and Commissioner Cleary join in Part III of the Commission's decision. Commissioner Cottine joins only in the conclusion, supra, that the Secretary established Bechtel's noncompliance with the cited standard. With this exception, his separate views are stated in note 10, infra.

conclude that the possibility of injury as a result of the unlocked wheels was too remote to warrant the imposition of an abatement requirement or the assessment of a penalty and, hence, the de minimis classification is appropriate.[10/] In light of this holding, we need not reach the parties' other arguments.[11/]

---

10/ Chairman Rowland emphasizes that the fatal fall was not due to the failure to lock all the wheels on the scaffold. Rather, as explained previously, the fatal fall occurred when Zaleski grabbed the top guardrail and pulled the guardrail loose. Therefore, Chairman Rowland disagrees with the suggestion that the occurrence of the accident supports characterizing the violation as serious.

Chairman Rowland also notes that a violation cannot be sustained unless the Secretary shows, among other things, employer knowledge of the non-complying condition. There is no evidence that Bechtel had actual knowledge of the unlocked wheels on scaffold "X". Nor does the record suggest that Bechtel could, with the exercise of reasonable diligence, have known of the unsecured wheels. Although Bechtel's supervisory personnel observed other scaffolds prior to the inspection, those scaffolds were 50 to 60 feet away. Indeed, even if the supervisory personnel had observed scaffold "X", it appears they would have concluded that the scaffold was in compliance, because scaffold "X" was marked with a tag which, according to Bechtel's work procedures, could not be attached unless the scaffold were completed and checked by the foreman. Furthermore, it is not dispositive that the shop steward discovered another scaffold with unlocked wheels; not only did his discovery involve a different scaffold, but his discovery did not occur at the time of the alleged violation. Accordingly, Chairman Rowland concludes that the Secretary did not establish that Bechtel knew or, with the exercise of reasonable diligence, could have known that three of the wheels on scaffold "X" were unlocked. While Chairman Rowland would normally vacate an alleged violation when, as here, the Secretary failed to show employer knowledge, Chairman Rowland agrees with Commissioner Cleary's decision to find a de minimis violation in order to reach a consensus in this case.

11/ Commissioner Cottine dissents to the de minimis classification of the violation. He would reject Bechtel's contention that, even if the wheels were unlocked, the scaffold was shown to be immobile at the time of the accident, based on the testimony of the paramedic who attempted without success to move the scaffold by himself. In Commissioner Cottine's view, the fact that the crouching paramedic alone could not move the scaffold--which the Secretary established would take two persons to move under normal circumstances--did not show that the scaffold was immobile. Furthermore, the paramedic's testimony does not establish that the scaffold was not subject to movement if the scaffold was tipped due to a weight shift at the top--24 feet above the floor. The crucial question is the effect of force applied 24 feet above the wheels. The record does not establish that failure to lock the wheels had only a negligible relationship to the stability of the scaffold.

(Footnote cont'd)

IV

For the foregoing reasons, Judge Osterman's vacating of the citation is reversed. The allegation of noncompliance with section 1926.451(e)(5) is affirmed as a serious violation of the Act. The allegation of noncompliance with section 1926.451(e)(8) is affirmed as a de minimis violation. Considering the gravity of the violation and Bechtel's size, good faith and prior history, the Commission assesses a penalty of $900 for the serious violation.

SO ORDERED.

FOR THE COMMISSION

Ray H. Darling, Jr.

Ray H. Darling, Jr.
Executive Secretary

Dated: AUG 31 1982

---

(Footnote 11 cont'd)

In addition, Commissioner Cottine notes that before a de minimis violation can be affirmed the Secretary must establish a prima facie case and any affirmative defense raised by the Respondent must be found to be without merit. Inasmuch as the majority ignores those prerequisites to affirmance of any violation and merely discusses the de minimis characterization of the alleged violation, it is necessary to address the other issues on review. He concludes that the Secretary established that Bechtel could, with the exercise of reasonable diligence, have known of the violative condition involving the failure to lock the wheels of the mobile scaffold, and he would reverse the judge's contrary finding. The evidence demonstrates that the unlocked condition of the wheels was not concealed from view and that Bechtel supervisory personnel passed by the scaffold frequently on the days prior to Zaleski's fall. Also, Bechtel had a workrule requiring inspection of all scaffolds following any alterations, and no such inspection was made.

Commissioner Cottine would also reject Bechtel's affirmative defense of unpreventable employee misconduct. Although Bechtel had a workrule requiring locking the wheels of mobile scaffolds, it cannot successfully defend on the basis of that workrule where its supervisors failed to inspect the scaffold as required. To sustain the defense an employer must have an adequate workrule that is uniformly and effectively communicated and enforced. H.B. Zachry, 80 OSAHRC 9/D8, 7 BNA OSHC 2202, 1980 CCH OSHD ¶ 24,196 (No. 76-1393, 1980), aff'd, 638 F.2d 812 (5th Cir. 1981). Where the employer does not conduct proper inspections to detect scaffold violations it has not shown uniform and effective enforcement of its safety rule. See, e.g., Paul Betty d/b/a Betty Bros., 81 OSAHRC 18/B11, 9 BNA OSHC 1379, 1981 CCH OSHD ¶ 25,219 (No. 76-4271, 1981). Other evidence that Bechtel's workrules were not adequately communicated or enforced includes: (1) Kertes' ignoring the rule to lock scaffold wheels during the week prior to the accident and (2) the union Steward's discovery of unlocked wheels on another mobile scaffold in use at the time of the inspection. The consequences of a fall from the improperly secured 24-foot scaffold could and did prove fatal. Accordingly, Commissioner Cottine would affirm the citation item as a serious violation of the Act.

ROWLAND, Chairman, dissenting in part:

I join the lead opinion in affirming a de minimis violation of section 1926.451(d)(8). However, I dissent from Commissioners Cleary and Cottine's determination that Bechtel violated section 1926.451(e)(5). I would vacate the alleged violation of section 1926.451(e)(5) and the alternatively alleged violation of section 5(a)(1).

As the majority notes, this case is analogous to H.E. Wiese, Inc., a case involving the interpretation of a similar standard, section 1926.451(a)(13). Consistent with my opinion in Wiese, a violation of the "proper access and exit" language in section 1926.451(e)(5) cannot be sustained, in my view, unless the Secretary shows non-compliance with other requirements in subpart L, or unless the Secretary shows other objective criteria which would indicate that the means of access and exit was "not proper." H.E. Wiese, supra, 10 BNA OSHC at 1508-9, 1982 CCH OSHD at p. 32,617 (dissenting opinion) and cases cited.

The Secretary did not introduce any evidence suggesting that the ladder to scaffold "X" did not comply with the other standards in subpart L. Indeed, the compliance officer's testimony on cross-examination, as well as the pictorial evidence, indicates that Bechtel's ladder complied with the specifications in subpart L.

Furthermore, the record does not show the existence of other objective factors which would have apprised Bechtel that the means of access and exit provided by the ladder was not "proper." Contrary to the majority's assertion that the location of the ladder below the beam required an employee to "swing . . . [his] leg up some 2 feet in the air and pull . . . [himself] up to the scaffold platform", the compliance officer's testimony and the Secretary's own pictures establish that the employees could have climbed to a level nearly adjacent to the

platform.[12/] Significantly, the shop steward--upon whose testimony the majority relies--stated that prior to the accident, neither he, nor the non-supervisory employees, nor the managerial personnel, considered the overhead beam to be a "problem" which interfered with access to the scaffold.[13/] Since the Secretary did not establish either non-compliance with the other standards in subpart L or other objective criteria which would indicate that access was not "proper", I would vacate the alleged violation of section 1926.451(e)(5).

I note that the testimony of both the Secretary's and Bechtel's witnesses suggest that the gist of the Secretary's case was that the scaffold floor itself was allegedly too high. In reality, the Secretary was not concerned about the location of the ladder. However, neither the cited standard nor any other standard in subpart L addresses the minimum clearance between the roof and the scaffold floor. If the Secretary seeks to require a minimum distance between the roof and the scaffold floor, he has the means and the obligation to do so by promulgating a specific standard. But he cannot distort an existing standard to impose an additional requirement. See B&B Insulation, Inc. v. OSHRC, 583 F.2d 1364, 1371-2 (5th Cir. 1978).

---

12/ For example, one of the Secretary's pictures, Exhibit C-7, shows the shop steward ascending the ladder. The compliance officer testified that in the picture, the shop steward's waist was approximately level with the platform, and that the distance from the shop steward's head to the beam was two and one-half feet. Thus, when crouching to slide between the guardrails, the shop steward could obviously climb a number of feet above his position in Exhibit C-7 before entering the platform.

13/ In this regard, I disagree with the majority's assertion that Bechtel was alerted to "similar problems" involving access to other "nearby" scaffolds. Although Bechtel was aware of other scaffolds for which access was temporarily

(Continued)

Moreover, I would vacate the alternatively alleged violation of section 5(a)(1), assuming that a section 5(a)(1) charge is proper. To establish a violation of section 5(a)(1), the Secretary must prove, among other things, the feasibility and likely utility of his proposed abatement methods. E.g., Williams Enterprises, Inc., 79 OSAHRC 24/A2, 4 BNA OSHC 1663, 1666, 1976-77 CCH OSHD ¶ 21,071, p. 25,361 (No. 4533, 1976).

The Secretary's witnesses discussed three means of abatement: installing a small "outrigger" platform between the ladder and the scaffold platform, relocating the ladder so it was not beneath the beam, and installing a gate in lieu of stationary guardrails at the entrance area.[14/] It is undisputed that an outrigger platform would not be feasible because it would tip the scaffold. Regarding the second method of abatement—relocation of the ladder—Bechtel's carpenter foreman stated that it was possible to move the ladder from beneath the beam in about one hour. However, moving the ladder would not be useful because the height of the scaffold would remain the same. As the majority acknowledges, Kertes testified, without contradiction, that the scaffold platform was so close to the ceiling that he could not stand upright. Furthermore, even if the ladder were relocated to another position unobstructed by the horizontal beam, an employee ascending the ladder would still be required to crouch

---

13/ (Continued)

blocked until corrective action was taken, the access to those scaffolds was obstructed by vertical beams, whereas the access to the scaffold in issue involved an overhead horizontal beam. Scaffold "X" was fifty to sixty feet from those scaffolds for which access was temporarily blocked. There were numerous scaffolds on the premises. Moreover, no employees complained about access to scaffold "X".

14/ Respondent's carpenter foreman also mentioned the use of safety belts and lanyards, but the feasibility of that method of abatement was not discussed by the Secretary's witnesses.

when departing from the ladder and sliding between the mid and upper guardrails. Similarly, a swinging gate apparatus would not alleviate the clearance between the roof and the scaffold platform. Moreover, to find a section 5(a)(1) violation based on the failure to furnish a swinging gate would essentially permit the Secretary to circumvent his own regulations, which require stationary guardrails on all open sides--including the access area--and which make no mention of swinging gates at the access point. See 29 C.F.R. section 1926.451(e)(10). Accordingly, I would affirm the judge's vacation of the citation.

Philadelphia, Pennsylvania
for the Complainant

James H. Hartl, Esq. and
Michael Floyd, Esq.
Bechtel Power Corporation
San Francisco, California
for the Respondent

OSTERMAN, Judge, OSHRC

This is a proceeding initiated by the Respondent to contest a Citation and Notice of Proposed Penalty issued to Respondent on or about September 14, 1977 following the investigation of Respondent's workplace on August 25 and September 2, 1977. A penalty of $900 was proposed. The investigation was conducted after the Secretary received word of a fatal accident which occurred on August 24, 1977.

The Secretary's complaint filed subsequent to the issuance of the Citation charged Respondent with "serious" violations of 29 C.F.R. 1926.451(e)(8) and 29 C.F.R. 1926.451(e)(5). Thereafter, the Secretary moved

to amend his complaint by adding the alternative allegation that Respondent violated either 29 C.F.R. 1926.451(a)(5) or Section 5(a)(1) of the Act by its failure to provide safe access and exit to a mobile scaffold involved herein. The Secretary's motion was granted (Tr. 6).[1/]

29 C.F.R. 1926.451(e)(5) reads as follows:

> A ladder or stairway shall be provided for proper access and exit and shall be affixed or built into the scaffold and so located that when in use it will not have a tendency to tip the scaffold. A landing platform must be provided at intervals not to exceed 35 feet.

29 C.F.R. 1926.451(e)(8) states that:

> Scaffolds in use by any persons shall rest upon a suitable footing and shall stand plumb. The casters or wheels shall be locked to prevent any movement.

With respect to "serious" violations this Commission and various circuit courts have held that, in order to succeed, the Secretary must establish that the employer had prior knowledge, either actual or constructive, of the existence of the hazardous condition involved, Secretary of Labor v. D. R. Johnson Lumber Co., Docket No. 3179, 1974-1975 OSHD § 19.695; Secretary of Labor v. Rockwell International, Docket No. 2875, 16 OSAHRC 444, 540 F.2d 1283 (6th Cir. 1976); Secretary of Labor v. Mountain States T & T Co., 2 OSAHRC 168; Secretary of Labor v. The Commission and Hendrix d/b/a Alsea Lumber Co., 511 F.2d 1139, 1143-45 (9th Cir. 1975).

---

1/ During the presentation of the Secretary's case discussions were held relating to the applicability of either 29 C.F.R. 1926.451(e)(5) and Section 5(a)(1) to the facts in this case. Because the court believed that some confusion resulted from these conversations, the court made it clear at the end of the Secretary's case that a decision to dismiss one of the alternative charges would be made only at the end of the entire case after Respondent had presented his defense (Tr. 127).

Section 5(a)(1) of the Act provides that:

> Each employer shall furnish to each of his employees employment and a place of employment which are free from recognized hazards that are causing or are likely to cause death or serious physical harm to his employees;

This section of the Act has been construed by various circuit courts to require that the Secretary, in order to succeed, must establish that the hazardous condition involved was known to the employer or to the Respondent's industry generally or that the employer must have been able to foresee the hazard. Empire-Detroit Steel v. OSHRC, 579 F.2d 278, 384 (6th Cir. 1978); Brennan v. Vy Lactos Labs, Inc., 449 F.2d 460 (8th Cir. 1974); Usery v. Marquette Cement Mfg. Co., 568 F.2d 902, 910 (24 Cir. 1977).

The record discloses that Respondent's corporation was engaged in the construction of The Limerick Power Plant, a nuclear energy facility located in Pottstown, Pennsylvania. On August 24, 1977, one of Respondent's employees, John Zaleski, fell from the top of a scaffold and was killed by the fall. On August 25 an investigation was commenced which resulted in the issuance of the Citation herein. The scaffold in question was a 24-foot high mobile scaffold with a 5 X 7 foot platform located in an area designated as Turbine Enclosure No. 1, elevation 269 (Tr. 11).

Because an overhead beam was located near the platform, the ladder attached to the scaffold could not be extended high enough to allow Zaleski to step directly from the ladder onto the platform and it was necessary for Zaleski to haul himself up a distance of approximately two feet from a rung on the ladder to the floor of the platform (Tr. 22). From this first platform, Zaleski would proceed to a second and adjacent platform where he was working on a welding job (Tr. 28). On August 24, after having made several

trips in this manner, Zaleski came up the ladder for the last time (Tr. 95, 110). When he ascended as far as he could he took hold of the top rail of the scaffold platform in order to haul himself up to the platform floor. The top rail, which was wired at each end to uprights on the platform, gave way with the result that Zaleski fell to the concrete floor below (Tr. 28-29, Ex. C-9).

The record shows that prior to Zaleski's accident, the platform which Zaleski was trying to reach when he fell was guarded by standard guardrails as required by 29 C.F.R. 1926.500(d)(1) (Tr. 26-27, 58, 60, 135, 144-146, 195). After the accident it was discovered that the mid-rail facing the ladder had been removed and was lying on the platform (Tr. 16, 212-213, Ex. C-8). The top rail which gave way when Zaleski fell was lying on the concrete floor below (Tr. 18, Ex. C-9).

The first issue to be determined is whether or not the Complaint was properly brought under 29 C.F.R. 1926.451(e)(5). That standard, which deals with mobile scaffolds, provides that a ladder or stairway for proper access and exit shall be affixed or built into the scaffold and so located that when in use it shall not have a tendency to tip the scaffold. The last sentence of the standard is not applicable since the scaffold involved was less than 35 feet in height. Because a beam was located directly above the scaffold it was impossible to extend the ladder so that an employee could step directly onto the platform from the ladder. To reach the platform it was necessary to reach up and around the side of the ladder in order to climb onto the platform which was at the height of a man's midsection (Tr. 17, 43, 47, Ex. C-7). The question to be resolved is whether the ladder provided for "proper access and exit" to the platform involved.

The Respondent urges inter alia that the scaffold met the requirements of the standard since it did have affixed to it a ladder; that the positioning of the ladder in relation to a landing platform is not a factor to be considered; and further that the matter of overhead obstructions is not covered by any standard (Respondent Br. 12 et seq.).

Section 1926.451 of 29 C.F.R. deals generally with the construction of mobile scaffolds and platforms on such scaffolds, and it is a reasonable assumption that the drafters of the regulation intended that a ladder should be so positioned on a scaffold so as to provide safe access to platforms on which employees would stand or work.[2/] To hold that the words "for proper access and exit" in subsection (e)(5) are surplusage and meaningless would emasculate the standard and defeat the purpose for which it was enacted.

Assuming, therefore, that the positioning of the ladder on the scaffold and its relationship to the platform involved violates the standard because "proper access and exit" to and from the platform was not provided, the further question to be resolved is whether the record supports a finding that Respondent had prior knowledge, either actual or constructive, of a potential hazard to its employees. The evidence on this point does not favor the Secretary.

The record shows clearly that Respondent had in place an ongoing and effective safety program and that Zaleski and all other employees attended

---

2/ It should be noted that the subsection immediately preceding (e)(5) deals with the construction of platforms.

regular toolbox safety meetings (Exs. R-1 thru R-4). When an employee believed that additional safety measures were necessary, a procedure was in place to remedy the unsafe condition (Tr. 132, 135, 144, 152-154, 173, 197-198).

With respect to the scaffold in question, testimony given by James Kertes, Zaleski's working partner, shows that both he and the deceased had used the scaffold for approximately a week before the accident and had previously been up and down at least six or eight times on the day that Zaleski fell to his death (Tr. 95, 110). Both Kertes and Zaleski knew that the top rail of the platform was "wired" and not bolted (Tr. 106-108). Kertes testified that safety meetings were held every Monday (Tr. 82-87, 109; Exs. R-1 thru R-4) and as indicated, above the records of those meetings substantiate the fact that Zaleski was present at those meetings (Exs. R-1, R-2, R-3, R-4). He further stated that the scaffold was not unsafe (Tr. 101) and that if either he or Zaleski had believed the scaffold to be unsafe he could have asked for safer access to be constructed and that appropriate corrections would have been made. He testified that neither he nor Zaleski had reported the scaffold as unsafe (Tr. 98-99, 106-108).

The Secretary argues that Respondent could have constructed an "outrigger" on the scaffold in question which would have eliminated the danger of falling. However, Kertes stated that he was not certain that an "outrigger" would increase the safety of the scaffold because of the increased weight on the overhang (Tr. 125-126), and there is substantial credible evidence that the addition of an "outrigger" to the platform could have tipped it over because of the added weight on one side, thus increasing the hazard to employees (Tr. 126, 150-151, 168, 169, 189-191).

Testimony given by Respondent's witnesses confirms the fact that no complaint had ever been made to indicate to management that the scaffold in question, or its positioning, was hazardous (Tr. 71-72, 74). On the basis of this record I must find that the Secretary has not established that the Respondent had either constructive or actual knowledge that a hazardous condition existed with respect to the scaffold.

On the issue of Section 5(a)(1) liability, the Secretary, as I have indicated above, is required to show that the hazard complained of is one which is known to the industry, or the Respondent, or which should have been known to the Respondent. The record shows that the normal method of reaching a platform from a ladder or a scaffold was to crawl between the top and middle guardrails of the platform or to get onto the platform "the best way you could" (Tr. 97, 136, 149-150). In the instant case this was the method used by Zaleski and his partner Kertes. On this point there is no evidence in the record that the Respondent was derelict with respect to the generally accepted practice in the industry.

The Secretary's proof that Respondent was guilty of a "serious" violation of 29 C.F.R. 1926.451(e)(8) suffers from a defect similar in nature to the proof which relates to Item 1 of the Citation, i.e., there is no evidence that Respondent had prior knowledge, actual or constructive, that the wheels on certain portable scaffolds were unlocked and that employees were thus exposed to a hazard.

## FINDINGS OF FACT

1. Respondent is a corporation organized and existing under the laws of the State of Nevada and having its principal office in San Francisco, California. Respondent is an employer subject to the jurisdiction of this Commission.

2. On all material dates Respondent was engaged in the construction of a nuclear power facility located in the vicinity of Pottstown, Pennsylvania.

3. On August 24, 1977, a pipefitter named John Zaleski employed by Respondent fell to his death from a height of 24 feet while attempting to climb onto the platform of a scaffold.

4. An investigation conducted by the Secretary of Labor during the period August 25 through September 2, 1977, was followed by the issuance of a Citation charging Respondent "serious" violations of 29 C.F.R. 1926.451(e)(5) or in the alternative Section 5(a)(1) of the Act and 29 C.F.R. 1926.451(e)(8). A total penalty of $900 was proposed.

5. The Secretary has failed to establish that Respondent had prior knowledge, either actual or constructive or that Respondent should have foreseen that a hazardous condition existed with respect to the scaffold and its ladder, or the platform, from which John Zaleski fell to his death on August 24, 1977, or that the Respondent had prior knowledge that the wheels on certain portable scaffolds were unlocked and presented a hazard to its employees.

6. The Secretary has also failed to establish by credible evidence that the scaffold involved, and the positioning of the ladder on the scaffold in relation to the platform involved created a hazardous condition which was known to the Respondent, or foreseeable by the Respondent, or known to the industry of which Respondent is a part.

## CONCLUSIONS OF LAW

During the period August 24, 1977 thru September 2, 1977, Respondent was not in violation of either 29 C.F.R. 1926.451(e)(5), Section 5(a)(1) of the Act or 29 C.F.R. 1926.451(e)(8).

## ORDER

Pursuant to Section 10(c) of the Occupational Safety and Health Act of 1970 and Rule 66 of this Commission's Rules of Procedure it is ORDERED:

1. That the Citation issued to Respondent on or about September 14, 1977 and the Secretary's Complaint filed on October 19, 1977 be, and the same hereby are, DISMISSED.

2. The Notice of Proposed Penalty which accompanied the said Citation is VACATED.

HENRY K. OSTERMAN
Judge, OSHRC

OCCUPATIONAL SAFETY AND HEALTH REVIEW COMMISSION

| | |
|---|---|
| SECRETARY OF LABOR,<br>Complainant,<br>v.<br>STANDARD MOTOR PRODUCTS, INC.,<br>Respondent. | OSHRC Docket No. 77-3939 |

DECISION

Before: ROWLAND, Chairman; CLEARY and COTTINE, Commissioners.

BY THE COMMISSION:

The Secretary of Labor issued a citation item alleging that Standard Motor Products violated 29 C.F.R. § 1910.217(c)(2)(i)(a). Administrative Law Judge Alfieri vacated the citation item because he found insufficient evidence that employees had access to the allegedly violative condition. We affirm the judge's disposition but on the ground that the evidence of noncompliance is insufficient.

Standard Motor operates a mechanical power press equipped with a hairpin guard that is interlocked with the press' ram. The hairpin guard has a six-inch by six-inch opening out of which stamped parts are ejected through a discharge chute. A box covered this opening. 1/ The compliance officer testified that, in an effort to relieve a jam or readjust stock, an employee might remove the box that covers the hairpin guard opening and reach through the opening into the point of operation, instead of stopping the press by raising the interlocked guard.

---

1/ Although the photographic exhibits do not show the box in position, the compliance officer testified that the box covered the opening when he inspected the machine. From this, we infer that the box was removed during the inspection for demonstrative purposes.

Section 1910.217(c)(2)(i)(a) states that point of operation guards on mechanical power presses "shall prevent entry of hands or fingers into the point of operation by reaching through, over, under or around the guard." A "guard," as that term is used in section 1910.217, is a "barrier." 2/ The record in this case must therefore show that the press lacked a barrier that prevented hands or fingers from reaching through the guard. The record is not sufficient on this point. It has not been shown and the Secretary does not argue that when the box covering the opening was in place, entry of the operator's hands or fingers by reaching through the hairpin guard was not prevented by a barrier. The Secretary also does not contend and the record does not show that the box had been removed when the violation allegedly occurred. Although the box may not have been fastened to the hairpin guard and may not have been interlocked with the press ram, we are reluctant to construe the cited standard to impose such requirements. Other standards within section 1910.217 specifically address those matters. See sections 1910.217(c)(2)(i)(d) and (c)(2)(iv). 3/

Accordingly, the judge's decision is affirmed.

SO ORDERED.

FOR THE COMMISSION

Ray H. Darling, Jr.

Ray H. Darling, Jr.
Executive Secretary

DATED: AUG 31 1982

---

2/ Section 1910.211(d)(32) defines "guard" as used in section 1910.217 as "a barrier that prevents entry of the operator's hands or fingers into the point of operation."

(Footnote 3 continued on next page)

---

3/ The majority disagrees with the statement in the dissenting opinion that the compliance officer's theory of how an employee might be injured on the L & J press "was corroborated by the fact that an injury had occurred recently on another of Standard's power presses"; the majority also disagrees with the significance of the statement in the dissent that a Standard employee "had received an injury after lifting [a hairpin] guard and attempting to manually clear another power press."

The compliance officer testified that on the Bliss press there were two openings in the hairpin guard large enough to permit an employee to insert his hand or fingers into the point of operation. The operator of the Bliss press was not injured by inserting his hand or fingers through the openings in the guard. He instead lifted the interlocked hairpin guard, inserted his fingers to clear a jam, and was injured when he activated a jog button. The compliance officer himself conceded that the circumstances of this accident had nothing to do with the later citation alleging violations of section 1910.217(c)(2)(i)(a) on either the Bliss or L & J machines. In view of these dissimilarities, we disagree with the dissenting opinion's conclusion that the injury on the Bliss press corroborated the compliance officer's theory of how an injury could occur on the L & J press.

COTTINE, Commissioner, dissenting:

I.

The compliance officer described how an injury could occur on the power press cited in this case:

> [I]f the press were to jam as it is in the automatic mode, an employee could put his hand in the point of operation to free a jam, to free a part which may have gotten hung up on some portion of the die or perhaps to realign the strip of metal as it is fed through the die through the point of operation. So, it is predictable that an employee could put his hands into that hole.

The compliance officer's opinion that an employee might reach his hand into the point of operation to free a jam and thereby injure himself was corroborated by the fact that an injury had occurred recently on another of Standard's power presses. Nonetheless, the majority vacates a citation for failure to guard the point of operation on a power press because an "oil-soaked cardboard box" happened to be over the press's discharge chute when the compliance officer first observed the machine. The cardboard box was removed during the inspection. There is no indication that the box generally was kept on the machine or that it was attached to the machine. Standard made no reference to the cardboard box in its defense. Up to now no one, including the judge, has put any significance on the presence of the box at the start of the inspection.

Numerous provisions of section 1910.217 amply demonstrate that cardboard boxes do not constitute machine guards. To conclude that the presence of the cardboard box precludes finding that employees were not protected by a guard to "prevent entry" of hands or fingers into the point of operation is to misread the standard and ignore well-established Commission precedent.

Section 1910.217 is intended to provide positive protection against injury resulting from bad judgment and deliberate disregard of safe procedures. This is clear from an examination of the language of section 1910.217 when it is read as a whole. Sections 1910.217(c)(2)(i)(a), (b), and (d) state:

> (2) Point of operation guards. (i) Every point of operation guard shall meet the following design, construction, application, and adjustment requirements:
>
> (a) It shall prevent entry of hands or fingers into the point of operation by reaching through, over, under or around the guard;
> (b) It shall conform to the maximum permissible openings of Table 0-10;
>
> * * *
>
> (d) It shall utilize fasteners not readily removable by operator, so as to minimize the possibility of misuse or removal of essential parts;

Table 0-10 provides:

| Distance of opening from point of operation hazard [In inches] | Maximum width of opening |
|---|---|
| 1/2 to 1 1/2. . . . . | 1/4 |
| 1 1/2 to 2 1/2. . . . . | 3/8 |
| 2 1/2 to 3 1/2. . . . . | 1/2 |
| 1 1/2 [sic] to 5 1/2. . . . . | 5/8 |
| 5 1/2 to 6 1/2. . . . . | 3/4 |
| 6 1/2 to 7 1/2. . . . . | 7/8 |
| 7 1/2 to 12 1/2 . . . . . | 1 1/4 |
| 12 1/2 to 15 1/2. . . . . | 1 1/2 |
| 15 1/2 to 17 1/2. . . . . | 1 7/8 |
| 17 1/2 to 31 1/2. . . . . | 2 1/8 |

This table shows the distances that guards shall be positioned from the danger line in accordance with the required openings.

Section 1910.217(c)(2)(iv) states:

> An interlocked press barrier guard shall be attached to the press frame or bolster and shall be interlocked with the press clutch control so that the clutch cannot be activated unless the guard itself, or the hinged or movable sections of the guard are in position to conform to the requirements of Table 0-10.

The maximum opening widths prescribed by Table O-10 are so narrow and the minimum safety distances so great that press guards meeting the table's requirements would prevent the operator from reaching into the point of operation. The reference in section 1910.217(c)(2)(i)(d) to "misuse or removal of essential parts" clearly indicates an intent to protect against even intentional employee misconduct. Section 1910.217(c)(2)(iv) specifically forbids reliance on an employee to activate a press without an interlocked barrier guard.

The cited standard, which seeks to preclude entry of hands or fingers into the point of operation "by reaching through, over, under or around the guard," is based on the judgment that guards must prevent entry of hands into the point of operation, whether entry is caused by inadvertence, poor judgment or intentional misconduct. It recognizes that employees do not always follow prescribed safety procedures and that the serious potential hazards associated with unguarded points of operation on power presses require reliance on fully effective physical guards.

II.

The majority cites no Commission cases to support its conclusions, although many similar cases have been decided. The Commission has consistently affirmed citations in comparable circumstances. For example, in Pass & Seymour, Inc., 79 OSAHRC 101/C13, 7 BNA OSHC 1961, 1979 CCH OSHD ¶24,074 ( No. 76-4520, 1979), appeal dismissed, No. 80-4013 (2d Cir. March 21, 1980), the Commission affirmed an alleged violation of

section 1910.212(a)(3)(ii)[4/] for an unguarded point of operation on an automatic molding machine. The Commission analyzed the case as follows:

> During the times when a tender operates a machine to clear it, the employee stands directly in front of the machine within reach of the point of operation. After jogging the machine to position it for clearing, the tender is supposed to use a metal rod hanging by a chain from the machine to perform the clearing operation. Respondent recognized that this operation could, if not performed properly, subject the employee to being injured at the point of operation, as exemplified by the training and warnings it gave its operators to avoid reaching into the point of operation. During the periods of normal operation of the machines, a tender does not have any duties to perform that require him to place his hands near the point of operation. However, the tender does observe the operation while in the five-foot wide aisles between the rows of machines. Thus, the tender must come within a few feet of the point of operation, and there is nothing to prevent him from getting his hand in a point of operation should he accidentally stumble or attempt to perform some adjustment on a machine while it is operating. Respondent argues, however, that the precautions it took were sufficient to avoid the point of operation hazard.

7 BNA OSHC at 1963, 1979 CCH OSHD at pp. 29,237-38. In rejecting the Respondent's argument, the Commission stated:

> The Commission has consistently held that the cited standard requires physical methods of guarding rather than methods of guarding that depend on human behavior. Hughes Brothers, Inc., [78 OSAHRC 65/A2, 6 BNA OSHC 1830, 1978 CCH OSHD ¶22,909 (No. 12523, 1978)]; Boonville Division of Ethan Allen, Inc., 78 OSAHRC 105/B4, 6 BNA OSHC 2169, 1979 OSHD ¶23,219 (No. 76-2419, 1978); MRS Printing, Inc., 78 OSAHRC 84/B10, 6 BNA OSHC 2025, 1978 CCH OSHD ¶23,102 (No. 76-3113, 1978); Akron Brick and Block Co., 76 OSAHRC 2/E2, 3 BNA OSHC 1876, 1976-77 CCH OSHD ¶20,302 (No. 4859, 1976). As the judge observed, the standard is intended to protect against injury resulting from an instance of inattention or bad judgment as well as risks arising from the operation of a machine.

Id.

---

4/ § 1910.212 General requirements for all machines.

(a) Machine guarding--

* * *

(3) Point of operation guarding.

* * *

(ii) The point of operation of machines whose operation exposes an employee to injury, shall be guarded. The guarding device shall be in conformity with any appropriate standards therefor, or, in the absence of applicable specific standards, shall be so designed and constructed as to prevent the operator from having any part of his body in the danger zone during the operating cycle.

There is no basis for distinguishing Pass & Seymour from the present case. In this case, the compliance officer testified without rebuttal that the operator stood one foot from the machine and was responsible for monitoring the press and clearing it in the event of a malfunction. The compliance officer also testified that an employee might neglect to shut off the press before attempting to clear it in an attempt to save time. The hairpin guard would not prevent entry into the point of operation if that occurred. Indeed, despite the presence of a guard, one of the Respondent's employees had received an injury after lifting the guard and attempting to manually clear another power press. As noted, there is absolutely no record evidence supporting the conclusion that the cardboard box was a suitable point of operation guard or that it prevented access to the point of operation. Common sense dictates that an oil-soaked cardboard box, that is not even affixed to the machine and is therefore readily removable, could not serve as a positive means of employee protection as required by the cited standard.

Since Pass & Seymour was decided the Commission has consistently affirmed citations alleging inadequately guarded points of operation where an employee had duties that could result in exposure to injury and has repeatedly stressed that there must be positive means of protection that are not dependent on human behavior. E.g., F.H. Lawson Co., 80 OSAHRC 19/A14, 8 BNA OSHC 1063, 1066-7, 1980 CCH OSHD ¶24,277 at p. 29,574 (No. 12883, 1980), appeal dismissed, No. 80-3277 (6th Cir. Feb. 9, 1981)(operator's hands were 10 to 20 inches from unguarded point of

operation during work cycle — a prima facie case of noncompliance with both 1910.212(a)(3)(ii) and 1910.217(c)(1)(i) established); Amforge Div., Rockwell International, 80 OSAHRC 46/A2, 8 BNA OSHC 1405, 1407, 1980 CCH OSHD ¶24,439 at p. 29,814 (No. 76-3488, 1980)(evidence that operator's hand "could" become caught in point of operation because of "both actual and potential" proximity of the employee's hands to the unguarded point of operation — point of operation hazard established); H.B. Zachry Co., 80 OSAHRC 69/A2, 8 BNA OSHC 1669, 1674, 1980 CCH OSHD ¶24,588 at p. 30,166 (No. 76-2617, 1980)(standard requires physical methods of guarding, not reliance on human behavior; where it is "possible" for an employee to place a hand or finger in the point of operation during the operating cycle, a "hazard, though remote, exists")(emphasis in original); Mayhew Steel Products, Inc., 80 OSAHRC 77/A2, 8 BNA OSHC 1919, 1920, 1980 CCH OSHD ¶24,678 at p. 30,286 (No. 77-3970, 1980)(machine guarding standards intended to prevent accidental presence of extremities in the point of operation; operator's fingers could come within inches of the stamp — this alone constitutes a hazard requiring protection); Dayton Tire & Rubber Co., 80 OSAHRC 95/D4, 8 BNA OSHC 2086, 2092, 1980 CCH OSHD ¶24,842 at p. 30,639 (No. 16188, 1980), appeal dismissed, No. 80-3755 (6th Cir. Aug. 18, 1981)(partial point of operation guarding inadequate — physical guarding rather than guarding methods that depend on human behavior required); American Package Co., Inc., 80 OSAHRC 102/E12, 8 BNA OSHC 2167, 2170, 1980 CCH OSHD ¶24,871 at p. 30,670 (No. 76-2349, 1980)("possible for the operator's hand to be in the point of operation and receive a crushing injury" because the operator "could . . . insert his or her hand into the point of operation" — point of operation hazard established);

Ornet Corp., 80 OSAHRC 116/C10, 9 BNA OSHC 1055, 1058, 1980 CCH OSHD ¶25,001 at p. 30,882 (No. 76-530, 1980)(no evidence that an employee's hand or arm "could be caught or pulled" into the machine -- hazard requiring guarding has not been established); Tube-Lok Products, 81 OSAHRC 17/B7, 9 BNA OSHC 1369, 1374, 1981 CCH OSHD ¶25,235 at p. 31,194 (No. 16200, 1981)(employees whose hands were at times 12 inches from point of operation during the operating cycle were exposed to the possibility of permanent injury, even though "the possibility of such an incident was low" -- standard violated); York Heel of Maine Inc., 81 OSAHRC 40/B11, 9 BNA OSHC 1803, 1807-8, 1981 CCH OSHD ¶25,351A at p. 31,474 (No. 78-5920, 1981)(operator's fingers "could" fit through a 1/2 inch gap into the point of operation -- employer violated the standard's requirements that a guard be designed so as to prevent entry); Columbian Art Works, Inc., 81 OSAHRC 96/F5, 10 BNA OSHC 1132, 1133 & n.2, 1981 CCH OSHD ¶25,737 at p. 32,102 & n.2 (No. 78-29, 1981)(standard requires physical guarding device designed to prevent employees from having any part of their bodies in the danger zone rather than reliance on employee skill or attentiveness); George C. Christopher & Sons, Inc., OSAHRC , 10 BNA OSHC 1436, 1444, 1982 CCH OSHD ¶25,956 at p. 32,532 (No. 76-647, 1982)(machine guarding "standards require a device that itself prevents the operator from endangering himself" and reject reliance on employee skill or attentiveness); American Luggage Works, Inc., OSAHRC , 10 BNA OSHC 1678, 1682-3, 1982 CCH OSHD ¶26,072 at p. 32,796 (No. 77-893, 1982)(standard requires physical guarding, not reliance on employee skill or attentiveness, and "is intended to eliminate danger from unsafe operating procedures, poor training, or employee inadvertence);

General Electric Co., 82 OSAHRC 31/C2, 10 BNA OSHC 1687, 1690-91, 1982 CCH OSHD ¶ 26,071 at p. 32,789 (No. 77-4476, 1982)(standard requires "physical guarding methods that do not depend for their effectiveness on correct employee behavior").

I would affirm the alleged violation on the basis of this precedent.

Appearances:

Francis V. LaRuffa, Regional Solicitor
United States Department of Labor
1515 Broadway, Room 3555
New York, New York 10036
Attorney for Complainant
by James A. Magenheimer, Esq., of Counsel

Nathaniel L. Sills, Exec. Vice-President
Standard Motor Products, Inc.
37-18 Northern Boulevard
Long Island City, New York 11101
For Respondent

## DECISION AND ORDER

Alfieri, Judge:

## STATEMENT OF THE CASE

This is a proceeding under Section 10 of the Occupational Safety and Health Act of 1970 (29 U.S.C. §651 et seq.) contesting one serious citation issued on November 11, 1977 by the Secretary against the Respondent under the authority vested in the Secretary by Section 9(a) of the Act (29 U.S.C. §658(a)).

The citation, consisting of two items each having two sub-items, alleges that an inspection made on September 16, 1977 and November 10, 1977, of Respondent's workplace, located at 37-18 Northern Boulevard, Long Island City, New York showed that the Respondent violated Section 5(a)(2) of the Act (29 U.S.C. §654(a)) because it failed to comply with the occupational safety and health standards promulgated under Section 6 of the Act (29 U.S.C. §655) and codified in 29 CFR 1910.217(c)(2)(i)(a) and 29 CFR 1910.217(c)(2)(i)(d) relating to mechanical power presses.

A single penalty of $210.00 is proposed. The abatement date for all items is December 9, 1977.

ITEM 1(a)

The standard 29 CFR 1910.217(c)(2)(i)(a) provides:

> (c) Safeguarding the point of operation.
>
> (2) Point of operation guards.
>
> (i) Every point of operation guard shall meet the following design, construction, application, and adjustment requirements:
>
> (a) It shall prevent entry of hands or fingers into the point of operation by reaching through, over, under or around the guard.

The violation is described as follows:

Point of operation guard(s) on mechanical power press(es) did not prevent entry of hands or fingers into the point of operation by reaching through, over, under or around the guard(s):

a) Power Press Dept. #13

1) "Bliss" press #27; front, guard allowed entry from left side and from underneath; rear, guard allowed entry from underneath.

2) "L & J" press #37; front, discharge chute opening allowed entry through the guard.

ITEM 1(b)

The standard 29 CFR 1910.217(c)(2)(i)(d) referring to point of operation guards provides:

> (d) It shall utilize fasteners not readily removable by operator, so as to minimize the possibility of misuse or removal of essential parts;

The violation is described as follows:

Point of operation guard(s) on mechanical power press(es) utilized fasteners readily removable by the operator, so as to create the possibility of misuse or removal of essential parts:

a) Power Press Dept. #13

1) "Bliss" press #27, rear barrier guard.

2) "L & J" press #37, front and rear barrier guards.

Pursuant to the enforcement procedure in Section 10 of the Act (29 U.S.C. §659), Respondent was informed of the alleged violations and the penalty proposed. Respondent timely contested.

During the course of the hearing held on March 20, 1978, the Secretary moved to withdraw that part of item 2, subpart a(2), which refers to the "front" of the barrier guard on the "L & J" press #37 (Tr. 53). The motion is granted.

## THE ISSUES

1. Whether or not the point of operation guards on Respondent's power presses meet the requirements of 29 CFR 1910.217(c)(2)(1)(a).

2. Whether or not the point of operation guards were secured by fasteners not readily removable by the operators as required by 29 CFR 1910.217(a)(2)(i)(d).

3. If Respondent failed to comply with one or both of the standards are the violations serious.

4. What penalty, if any, is appropriate if Respondent is found in violation of one or both standards.

## SUMMARY OF THE EVIDENCE

Called by the Secretary, James Lark testified that he has been a compliance officer for the Occupational Safety and Health Administration for the past five years. During that time he has conducted about 500 inspections.

On September 16, 1977,[1/] he appeared at Respondent's workplace and held an opening conference with Mr. Slame, Respondent's personnel manager, and its plant superintendent Mr. Kirschberger (Tr. 11). At that time he informed both gentlemen that he was

---

1/ Due to compliance officer's illness inspection was concluded on November 6, 1977 (Tr. 10).

there to investigate two industrial accidents reported by the Respondent to have occurred at a Bliss power press and an L & J power press (Tr. 12). The investigation was to be limited to two presses.

Lark's investigation disclosed that the accidents were the result of employees violating Respondent's safety policy (Tr. 19, 34) and were not related to any violative conditions for which Respondent was cited and now contests.

Accompanied by Kirschberger, Lark conducted the walk-around inspection. The conditions that he observed and the information he gathered which resulted in Respondent being cited follow:

Item 1(a)(1) - 29 CFR 1910.217(c)(2)(i)(a)

Bliss power press No. 27, which was button controlled, ran 16 hours a day (Tr. 17) and was equipped with a hairpin-type barrier guard (Tr. 14) that when opened, automatically stopped the press (Tr. 15). The guard on the front of the press, left a five-inch wide and 30-inch long unprotected space at the bottom. On its left side, the unprotected area was also five inches wide but 24 inches long (Tr. 14). This is shown in the photograph Exhibit C-1. These openings in Lark's opinion, would not completely prevent an employee from putting his fingers and "perhaps" part of his hand into the point of operation six to eight inches in from the guard (Tr. 14-15). Lark described the way he was able to get his hand behind the guard as follows:

THE WITNESS: Your Honor, I had to take my hand and at the lower portion of the guard with it completely in place, I had to bend my wrist so that my hand was in a ninety degree angle to my wrist and then reach over the bed of the press and I could have reached the point of operation had I gone a little bit further. (Tr. 16).

Later when cross-examined about this Lark answered as follows:

Q. One other question for you. How high off the floor is this opening at the bottom of the press in Exhibit 1?

A. I did not measure it. I would say it's about thirty-six inches.

Q. Three feet off the floor?

A. Right.

Q. Tell me how a man can get his hand up there to the point of operation?

A. Sir, a man would have to bend at his waist or at his knees; he would have to put his hand in.

Q. Flat in? (Tr. 55)

A. Flat in. He would then have to rotate his hand at the wrist.

Q. Couldn't get it up to the elbow, could have?

A. Admittedly, with difficulty.

Q. Then what would he have to do?

A. Once he had his hand in, he could straighten his hand.

Q. He'd have to go this way?

A. With his arm and then he would have something of an S. He would have something of an S configuration of his hands to fingers.

Q. All he would have is about the length of his fingers to get to the point of operation?

A. His fingers would get there.

Q. That's all he would have after he got to the press to have his fingers in there, like an ostrich?

A. I don't catch your analogy.

Q. Pretty difficult isn't it?

A. Yes, sir.

Q. Pretty problematical?

A. Yes, sir. (Tr. 56)

The hazard foreseen by Lark was that if an employee introduced his hand into the point of operation that injury would be amputation, laceration or fracture (Tr. 17).

Item 1(a)(2) - The "L & J" press #37

This press also was operated by button control and after three strokes it would function automatically (Tr. 29).

Lark observed that it too had a hairpin-type barrier guard. At the bottom of the guard there was a six-inch by six-inch opening (Tr. 28, 32) through which there was a chute for discharging fabricated parts into a cardboard box (Tr. 28). When the box was removed according to Lark, an employee, in an

effort to relieve a jammed machine, (Tr. 31, 32) could put his entire hand and fingers into the opening and reach the point of operation - four to six inches in from the barrier guard (Tr. 28). Exhibit C-2 shows the violative condition described by Lark.

When cross-examined, Lark testified that if the press were to jam, the operator would not open the guard which deactivated the press (a) to save time and (b) because he is too lazy to raise the barrier (Tr. 63). Lark identified Exhibit R-1 as a photo of the same press shown in Exhibit C-2.

Lark classified the violations as serious because of the potential of injuries such as amputations.

Item 1(b)(a)(1) - 29 CFR 1910.217(c)(2)(i)(d)

Bliss press #27: Lark observed that the rear of the press had a barrier guard that was secured by a piece of twisted wire (Tr. 39). He anticipated that the press operator would open the guard to free a jammed machine or make an adjustment. The guard, which when opened did not shut off the press, was six to eight inches from the point of operation (Tr. 40). Exhibit C-3 depicts the barrier guard.

Cross-examination of Lark disclosed that the space between the wall and the guard was about 18 to 24 inches (Tr. 64).

Item 1(3)(a)(2) - L & J press #37

Lark testified that this press also had a rear barrier guard that when opened did not shut off the press (Tr. 43). The guard was secured by a latch that was very easy to open (Tr. 45). In his presence, Mr. Kirschberger opened the latch with a flick of the wrist (Tr. 68). He foresaw the possibility of the press operator or an unauthorized person gaining access to the point of operation by opening the rear guard (Tr. 43-44). Exhibit C-4 depicts the condition described by Lark.

Lark classified the violations as serious because they could cause amputations, fractures or deep lacerations (Tr. 47).

In computing the proposed penalty of $210.00, Lark gave Respondent the maximum 30% for good faith. Because it had more than 99 employees Respondent received no credit for size. No credit was given for history because of a prior inspection (Tr. 50).

Respondent's case

William C. Crager, a safety consultant for the past 50 years, was called by the Respondent. He testified that he makes scheduled monthly visits to Respondent's plant. He devotes one-half of the day to inspecting for hazards and observing work practices. The other half is devoted to meeting with the Respondent's safety committee (Tr. 72) which includes a representative of the employees (Tr. 73). He expressed the opinion that none of the violations were serious.

On cross-examination, Crager stated that all of the opening measurements that he testified to on direct examination, were made after the compliance officer's inspection (Tr. 79, 80) and after Respondent made modifications to the various violative conditions (Tr. 80).

## DISCUSSION

This proceeding was initiated by injuries sustained by two employees who concededly violated the safety rules of an employer that has an outstanding safety program. Although the employees were injured while operating the Bliss & "L & J" presses involved here, none of the violative conditions reported by the Secretary's compliance officer in anyway contributed to their injuries.

Directing our attention to item 1(a)(1) which alleges that the front guard of the Bliss press #27 permitted the entry from the left side and from underneath, the allegations must be vacated for failure to show reasonable predictability of access to the hazardous condition.

Dispositive of the question is the ruling of the Commission in Secretary v. Gilles & Cotting, Docket No. 504, 3 OSHC 2002 (1976).[1/] Gilles & Cotting set forth the following guideline in those cases where actual exposure to the danger zone is not shown or conceded:

---

1/ Decision following Remand, 504 F.2d 1255 (4th Cir. 1974).

> . . . On balance we conclude that a rule of access based on reasonable predictability is more likely to further the purposes of the Act than is a rule requiring proof of actual exposure. . . . (Emphasis added) . . . [W]e would expect Complainant, absent an admission to establish access by evidentiary facts.

What constitutes "reasonable predictability" will of course vary. It is a relative term whose meaning is shaded and varied by the facts of a particular case. Its application to the determination of access to the danger zone bars the rigidity of mandating a finding of a violation in every case where access is shown regardless of the method or the manner adopted to achieve it. Any other view would produce harsh results never intended by the framers of the Act.[2/]

The term "reasonable predictability" however, is not so uncertain that an employer cannot comply with the Commission's ruling.

Relevant to the question, but by no means exclusive, is whether or not the employer-respondent exercised diligence to the extent of having a safety program which it uniformly or affectively enforced. For, the Commission has held that the Act does not impose an absolute liability upon employers when an employee fails to follow established safety practices. Brennan v. OSAHRC & Hanovia, 502 F.2d 946 (3rd Cir. 1974); Secretary v. Engineers Const. Inc., 20 OSAHRC 348 (1975).

---

2/ The Act is very specific. Section 2(a) states that the Congressional intent is . . . [T]o assure as far as possible every working man and woman in the Nation safe and healthful working conditions.. . . .

In an effort to show access to the zone of danger, here the point of operation, within the Gilles & Cotting (supra) guidelines the Secretary's compliance officer obviously contorted his body and limbs well beyond ordinary expectations. He engaged in a strained physical effort to place his fingers within the danger zone. His explanation that to do this required him to make an "S configuration of his hands to fingers" (Tr. 56) strains credulity. Access which is reasonably predictable involves the probable and foreseeable act of an employee.

Here, the Respondent has equipped the Bliss press #27 with a guard that when opened deactivated the machine. Respondent has an outstanding safety program. Its efforts to anticipate or foresee hazardous conditions are firmly demonstrated by monthly safety inspections and employee participation safety meetings. In the light of these hard facts it cannot be concluded that Respondent could reasonably predict that its employee would engage in the same strained and contorted physical effort to gain access to the danger zone as the compliance officer did. The more reasonable conclusion is that if in fact the employee did do that he would, like the two injured employees, be violating company policy.

The Secretary cannot be upheld where, as here, he shows the possibility of access by strained and contorted effort while ignoring the foreseeability.

The remaing part of the item, subpart 1(a)(2), has a similar fatal defect. There is no quarrel about there being a front guard on the "L & J" press #37 which when opened will deactivate it. Thus, here too the test is "reasonable predictability" of access. The testimony of the compliance officer that the Respondent's machine operator would place his hand into the open chute because he would be too lazy to open the guard or would not open it to save time is highly speculative and imaginary.

It does not constitute that quality of proof upon which it can reasonably be predicted that an employee will have access to the danger zone. Secretary v. Gilles & Cotting (supra). The preponderance of the evidence rule is applicable in these proceedings. Olin Construction Company Inc. v. OSAHRC, No. 74-2516 (2nd Cir. 9/9/75); Secretary v. Armor Elevator Company, Inc., 5 OSAHRC 260 (1973). Complainant has not sustained the burden of proof.

The allegation in Item 1(b)(a)(1), that Respondent has violated 29 CFR 1910.217(c)(2)(i)(d) because it did not utilize proper fasteners for the rear barrier guard on Bliss press #27 is supported by the record. The twisted wire fastener does not meet the requirement that it be not readily removable. Not foreign to the hazardous condition is the undisputed fact that the rear barrier guard when opened did not deactivate the press.

There remains for disposition the same allegation in item 1(b)(a)(2) of inadequacy of the rear barrier guards for the

"L & J" press #37. The Secretary's evidence shows that the latch on the guard was easily flipped open by Respondent's plant superintendent, Mr. Kirchberger.

The facts and circumstances surrounding this alleged violation also support the Secretary's contention that the Respondent's employee would have access to the zone of danger. Gilles & Cotting (supra). However, the Respondent cannot be held accountable for an unauthorized person's presence in the danger zone.

Respondent's safety expert, William C. Crager, gave credible testimony about the plant safety program. However, his testimony concerning the openings in the various barrier guards on the presses must be discounted. It is based on measurements taken of the guards modified subsequent to the Secretary's inspection.

The citation charges the Respondent with serious violations. Under the applicable provisions of Section 17(k) of the Act (29 U.S.C. § 666(j)), a violation is serious if there is a substantial probability that death or serious physical harm could result from the violation and the employer knew, or with the exercise of reasonable diligence, could have known of the presence of the violation. Here Respondent's employees were exposed to or had access to hazardous areas of the points of operation of the presses. In all probability hand or finger caught in the presses would result in a serious if not fatal injury. There is little reason to believe that an injury sustained by a press operator from the power driven presses would not be serious.

Relative to the element of knowledge of the existence of the violations, the Secretary has established that by the frequent safety inspections conducted by Respondent.

Respondent's expert William Crager's testimony relative to the serious nature of the violations constitute simply a conclusion without supporting evidence. It is rejected.

The penalty proposed for all of the items is $210.00. The single penalty was based on the violations grouped to make up the one citation. Since all of the violations were of approximately equal gravity and some have not been vacated, an adjustment is necessary. In addition to examining all of the evidence I have considered all of the criteria set forth in Section 17(j) of the Act in assessing the penalties for the several violations.

Having heard the testimony of the witnesses and having observed their demeanor, it is concluded that the preponderance of the credible evidence supports the following:

## FINDINGS OF FACT

### Item 1(a)(1)

1. The front barrier guard on Bliss press #27 had an opening at the bottom five inches high and 30 inches long and an opening on the left side five inches wide and 24 inches long.

2. It is not likely or foreseeable that the Bliss press #27 operator would engage in the same contortions as the compliance officer to reach the danger zone.

3. It was not reasonably predictable by Respondent that the operator of Bliss press #27 would have access to the danger zone, i.e., the point of operation in the front of the press.

4. The Bliss press #37 operator did not have access to the danger zone.

Item 1(a)(2)

5. It is neither likely nor reasonably predictable by Respondent in the light of Respondent's excellent safety program, that the operator of "L & J" press #37 would place his hand into the danger zone because of laziness or to save time rather than open the rear guard which deactivates the press.

6. The operator of "L & J" press #37 did not have access to the danger zone in the rear of the press.

Item 1(b)(a)(1)

7. The barrier guard on the rear of Bliss press #27 was fastened by twisted wires which were readily removable by the operator.

8. The operator of Bliss press #27 had access to the zone of danger through the rear barrier guard.

Item 1(b)(a)(2)

9. The barrier guard on the rear of "L & J" press #37 was secured by a latch that was readily removable by the operator.

10. The operator of "L & J" press #37 had access to the danger zone through the rear barrier guard.

## CONCLUSIONS OF LAW

1. Respondent is, and at all times material hereto was, engaged in a business affecting commerce within the meaning of Section 3(5) of the Occupational Safety and Health Act of 1970.

2. Respondent is, and at all times material hereto, was subject to the requirements of the Occupational Safety and Health Act and the standards promulgated thereunder and the Commission has jurisdiction of the parties and of the subject matter herein.

3. Respondent did not fail to comply with 29 CFR 1910.217 (c)(2)(i)(a) as alleged in item 1(a)(1).

4. Respondent did not fail to comply with 29 CFR 1910.217 (c)(2)(i)(a) as alleged in item 1(a)(2).

5. Respondent was in violation of Section 5(a)(2) of the Act (29 U.S.C. 654) because it failed to comply with 29 CFR 1910. 217(c)(2)(i)(d) as alleged in item 1(b)(a)(1).

6. Respondent was in violation of Section 5(a)(2) of the Act (29 U.S.C. 654) because it failed to comply with 29 CFR 1910. 217(c)(2)(i)(d) with respect only to the rear barrier guard as alleged in item 1(b)(a)(2).

7. Considered within the provisions of section 17(j) of the Act (29 U.S.C. 666(i)), the amount of the proposed penalty

for failing to comply with 29 CFR 1910.217(c)(2)(i)(a) and 29 CFR 1910.217(c)(2)(i)(d) is not under the circumstances appropriate and should be reduced.

**ORDER**

Items 1(a)(1) and 1(a)(2) are vacated.

That part of item 1(b)(a)(2) which refers to the "front" barrier guard is vacated.

Item 1(b)(a)(1) is affirmed.

Item 1(b)(a)(2) insofar as it refers to the "rear" barrier guard is affirmed.

A single penalty of $50.00 is assessed for items 1(b)(a)(1) and 1(b)(a)(2).

DECISION

Before: ROWLAND, Chairman; CLEARY and COTTINE, Commissioners.

BY THE COMMISSION:

The authorized representative of the affected employees in this case, Progressive Steel Workers Union ("the union"), has petitioned for review of an order by Administrative Law Judge Ralph B. Maxwell approving a settlement agreement entered into by the other two parties, the Secretary of Labor ("the Secretary") and Wisconsin Steel Division of Envirodyne Industries ("the company"). Commissioner Cottine granted the petition and directed review under 29 U.S.C. § 661(i), section 12(j) of the Occupational Safety and Health Act of 1970, 29 U.S.C. §§ 651-678.

Judge Maxwell held a hearing at which the union presented its objections to the settlement agreement and the parties presented oral argument. No testimony was taken but the judge admitted into evidence a written statement of the union's objections and a copy of the collective bargaining agreement between the company and the union. Following that hearing, Judge Maxwell entered an order overruling

the objections to the settlement agreement, stating that the employee representative had "failed to demonstrate, by a preponderance of the evidence, that the proposed Settlement Agreement . . . is unreasonable or improper." Judge Maxwell subsequently approved the settlement agreement.

The union's petition for review argues that the judge's order was inadequate because it is not clear whether the judge held that the union had no standing to object to the settlement agreement or whether he overruled the objections on their merit. In either case, the union argues, the judge's decision does not explain why the union's objections were found to lack merit.

We have recently held that an authorized employee representative that elects party status in the contest of a citation before this Commission is entitled to be heard on its objections to a settlement agreement between the Secretary and the employer. Mobil Oil Corp., 82 OSAHRC ____, 10 BNA OSHC _____, 1982 CCH OSHD ¶ _____ (No. 77-4386, 1982). In addition, we agree with the union that the reasons for the judge's order overruling its objections were not adequately set out. 1/ While the wording of the order suggests that the judge gave the union's objections full consideration, it is not clear why he overruled them. We therefore remand this case for a statement of reasons why the union's

---

1/ Where, as here, a union objects to a settlement agreement, the judge is required to make findings of fact on the issues raised and to enter conclusions of law based on Commission Rule 100. 5 U.S.C. § 557(c); P & Z Co., 77 OSAHRC 211/F5, 6 BNA OSHC 1189, 1191, 1977-78 CCH OSHD ¶ 22,413, p. 27,023 (No. 76-431, 1977). We note that the standard for reviewing a settlement proposal is not whether it is "unreasonable or improper" but whether it satisfies the requirements of Commission Rule 100(a) and (b), 29 C.F.R. § 2200.100(a) and (b).

objections were overruled and for any further consideration that may be appropriate in light of our decision in Mobil. 2/

SO ORDERED.

2/ Chairman Rowland does not join in remanding this case for further consideration of the union's objections to the abatement measures set out in the settlement agreement. For the reasons explained in his dissenting opinion in Mobil, the Chairman believes consideration of the settlement agreement should be limited to any objections the union may have to the reasonableness of the abatement period agreed upon by the Secretary and Wisconsin Steel. Since the union's petition for discretionary review raised no objection to the reasonableness of the abatement period, in the Chairman's opinion, further consideration of the adequacy of the settlement agreement is inappropriate.

## ORDER APPROVING SETTLEMENT

A Settlement Agreement having been filed by the parties on October 12, 1979, and it appearing that thereafter the employee representative objected in writing to certain provisions of the Settlement Agreement, and that a hearing on such objections was duly held on December 10, 1979; and it further appearing that by Order dated December 11, 1979, the objections to the Settlement Agreement were overruled, it is now ORDERED as follows:

1. The Settlement Agreement is in all things approved.

2. The Citation and Notification of Penalty shall be amended as set forth in Paragraph I of the Agreement.

3. The respondent shall be allowed to withdraw its Notice of Contest and Answer.

4. The Citation, as amended, and the proposed amended penalty of $5,000.00 are affirmed.

DECISION

Before: ROWLAND, Chairman; CLEARY and COTTINE, Commissioners.

BY THE COMMISSION:

Various related rulings made by Administrative Law Judge John S. Patton are before the Commission on interlocutory appeal. Judge Patton concluded that Local No. 370 of the Allied Industrial Workers of America ("the Union") has a right to present evidence and be heard on its objections to a settlement agreement between the Secretary of Labor ("the Secretary") and Respondent, Whirlpool Corporation. Specifically, the judge ruled that (1) the Union is not limited to raising issues related to abatement but can litigate the appropriateness of any part of the settlement agreement, including the change in the classification of the violation from serious to other than serious; (2) the issue to be resolved is whether the settlement agreement is appropriate rather than whether the alleged violation is meritorious; (3) the entire

settlement agreement will be set aside if any part of the agreement is found to be improper; and (4) a hearing on the merits of the case will then be held if the settlement agreement is not approved. The judge's rulings are consistent with our recent decision in Mobil Oil Corp., OSHRC Docket No. 77-4386 (Aug. 6, 1982). See also, Englehard Industries, OSHRC Docket Nos. 78-2880 & 78-3251 (Aug. 30, 1982). The judge's rulings are therefore affirmed.

While this case was pending on review, the Union filed with the Commission a motion for an order compelling the production of documents in the Secretary's possession. The Secretary responded by filing a memorandum in opposition to the Union's motion in which he raised several procedural objections to the Commission's consideration of the motion and also asserted that the requested documents are exempt from discovery under Rules 26(b)(3) and (b)(4) of the Federal Rules of Civil Procedure. We decline to rule on this motion. The motion raises issues that are beyond the scope of the interlocutory appeal and that the judge has not had the opportunity to rule on in the first instance. Moreover, these issues are not easily resolved in light of the Secretary's claims of privilege and the need to provide the Union an opportunity to respond to those claims. Therefore, in the interest of adjudicative efficiency, we conclude that the Union's motion should be considered and resolved on remand.

Accordingly, the judge's rulings are affirmed and the case is remanded to the Chief Judge [1/] for further proceedings consistent with this opinion. [2/]

SO ORDERED.

FOR THE COMMISSION

Ray H. Darling, Jr.
Ray H. Darling, Jr.
Executive Secretary

DATED: AUG 31 1982

---

1/ Judge Patton has retired.

2/ Chairman Rowland dissents from the affirmance of the judge's rulings. For the reasons explained in his dissenting opinion in Mobil, the Chairman believes consideration of the settlement agreement should be limited to any objections the Union may have to the reasonableness of the abatement period agreed upon by the Secretary and Whirlpool. Since the Union has raised no objection to the reasonableness of the abatement period, in the Chairman's opinion, further consideration of the adequacy of the settlement agreement is inappropriate. For this reason, the Chairman would also deny the Union's motion for an order compelling the production of documents.

## ORDER RECERTIFYING INTERLOCUTORY APPEAL

Interlocutory Appeal was previously certified in this case and the Interlocutory Appeal was dismissed as improvidently certified.

The complainant and respondent executed a settlement agreement in this case to which the intervening union objected. On September 19, 1979, a hearing was held to determine, first, whether the objections of the union to the settlement agreement had the effect of nullifying the settlement agreement, making it necessary to proceed to a hearing on the merits of the case, or whether the issue to be decided was the appropriateness of the settlement agreement itself. The second issue at said hearing was whether the union had a right only to object to issues relating to abatement or whether the union had a right to object to any part of the settlement agreement. No evidence was introduced at this hearing but said issues were thoroughly argued by the representatives of all parties in this cause. At said hearing, this Judge ruled on each of the above described issues, his ruling being made from the bench in open court and being a part of the transcript of the hearing of said cause.

[illegible] in the transcript. Thirty errors were [illegible] by the Judge in an errata dated October 16, 1979, and, at the request of the parties, twenty additional errors were corrected by errata dated November 21, 1979. It is necessary to refer to the erratas to understand the transcript. Errors which changed the meaning of what was said were corrected. However, even after the corrections, errors still appear in the transcribing of statements of the Judge as to reasons for his rulings, which errors make it difficult to understand said statements by the Judge. Quotation marks do not appear where they belong, sentences are broken at the wrong places and words are omitted. The rulings of the Judge, however are correctly stated. Therefore, to save further delay, no additional errata will be submitted to the parties at this time.

The decision of the Judge will be found in the transcript at the following places. The reference to line is by actual count and not necessarily by the numbers appearing in the transcript.

Beginning on page 11, line 14, through page 12, line 10, the Judge, while stating that he was not at that time ruling on the intervenor's request for continuance, did state in discussion of the question of continuance, part of his ruling as to the procedure to be followed in ruling on the intervenor's objections to the settlement. The Judge's further ruling is found beginning on page 43, line 4, of the transcript with the words "I realize" and ending with the words "non-serious" in line 9, page 43 and on page 45, line 17, beginning with "my question", and ending on page 46, line 14.

At the conclusion of the ruling of the Judge, counsel for complainant requested that the Judge certify an Interlocutory Appeal from said ruling and counsel for the other parties stated that they had no objections to an Interlocutory Appeal being certified.

The Judge stated on the record that the motion that he certify an Interlocutory Appeal was granted. The Judge subsequently on November 21, 1979, did certify an Interlocutory Appeal. The Judge in the certification of Interlocutory Appeal, however, failed to state that the decision of the Judge was made in open court and that it appears as a part of the transcript of the hearing on September 19, 1979.

The Review Commission thereupon on December 7, 1979, as a result of this Judge failing to properly make known to the Review Commission that said decision had been rendered from the bench, entered an order dismissing the Interlocutory Appeal on the ground that no decision had been rendered by the Judge and that the effect of the certification was to request in essence, a declaratory judgment.

In view of the fact that this appeal was dismissed on the ground that no decision had been rendered, whereas in actuality a decision was rendered from the bench, it would appear that this Judge should again certify an Interlocutory Appeal from said decision. This Judge at this time also reaffirms the decision rendered from the bench on September 19, 1979, said decision being as follows:

Hearing on the objections of the union to the settlement agreement shall be a hearing on the appropriateness of the settlement agreement, not a hearing on the merits of the complaint as though a settlement agreement had not been executed.

In the event any part of the settlement agreement is found not to be proper, the entire settlement agreement shall be set aside and a hearing on the merits of the case shall be held as though no settlement agreement had been executed.

The position of complainant and respondent that the union may object only to issues relating to abatement is overruled.

The union is hereby permitted to litigate the appropriateness of any part of the settlement agreement, including whether the alleged violation is serious or nonserious.

It appears that the ruling of the Judge as above set forth involves important questions of law concerning which there is substantial ground for differences of opinion. It also appears an immediate appeal from said ruling will materially expedite the proceedings.

For these reasons and the reasons set forth in the original certification of Interlocutory Appeal, the request for certification of Interlocutory Appeal of said ruling of this Judge is granted and Interlocutory Appeal is hereby certified.

Dated this 14th day of December 1979.

JOHN S. PATTON

DECISION

Before: ROWLAND, Chairman; CLEARY and COTTINE, Commissioners.

BY THE COMMISSION:

A decision of Administrative Law Judge Richard DeBenedetto is before the Commission for review pursuant to section 12(j), 29 U.S.C. § 661(i), of the Occupational Safety and Health Act of 1970, 29 U.S.C. §§ 651-678 ("the Act"). In his decision, Judge DeBenedetto granted the motion filed by Respondent, General Motors Corporation, Fisher Body Division ("G.M."), to dismiss the case under Rule 41(b) of the Federal Rules of Civil Procedure. 1/ Accordingly, he vacated the

---

1/ In the absence of a specific Commission rule, the Federal Rules of Civil Procedure are applicable to Commission proceedings. Section 12(g) of the Act, 29 U.S.C. § 661(f); 29 C.F.R. § 2200.2(b). Rule 41(b) provides, in pertinent part:

> (b) Involuntary Dismissal: Effect Thereof. For failure of the plaintiff to prosecute or to comply with these rules or any order of court, a defendant may move for dismissal of

one citation item at issue, which alleged an other than serious violation of the Act based on noncompliance with the occupational noise standard at 29 C.F.R. § 1910.95(b)(1), and he further vacated the proposed penalty of $100. Review was directed on the issues raised in the petition for review filed by the Secretary of Labor ("the Secretary"): (1) whether Judge DeBenedetto erred in denying the Secretary's motion to postpone the hearing and his request for production and inspection of documents, and (2) whether the judge abused his discretion in granting Respondent's motion to dismiss under Rule 41(b). We conclude that the judge did not err in denying the Secretary's motions to postpone the hearing and to conduct further discovery; nor did he abuse his discretion in granting the motion to dismiss.

I

Given Judge DeBenedetto's detailed presentation of the procedural history of the case in his decision, we only briefly state it here. On October 31, 1979, only one day before the scheduled hearing in this case, the Secretary filed with the judge a motion to postpone the hearing for at least one month. The Secretary gave the following reasons for his motion to postpone: (1) Norman Dotti, the Secretary's acoustical engineering expert, was unable to meet with the Secretary's counsel prior to the hearing due to Dotti's previously-scheduled commitments from October 25 to November 1, 1979; (2) because he had never received certain information that he had requested during his discovery inspection conducted on October 17, 1979, Dotti was unable to complete his report on the technological and economic feasibility of engineering controls to reduce noise levels in the cited areas of G.M's facility; and (3) the Secretary's preparation period had been "diminished

---

(Footnote 1 cont'd)

> an action or of any claim against him. . . . Unless the court in its order for dismissal otherwise specifies, a dismissal under this subdivision and any dismissal not provided for in this rule, other than a dismissal for lack of jurisdiction, for improper venue, or for failure to join a party under Rule 19, operates as an adjudication upon the merits.

significantly" as a result of a three-week delay in Dotti's discovery inspection due to complications arising from G.M.'s request that Dotti execute a trade-secrecy oath before conducting the discovery inspection. At the same time he filed the motion to postpone, i.e., one day before the hearing, the Secretary filed an extensive and generally-worded request for production and inspection of documents.

Rule 61 of the Commission's Rules of Procedure, 29 C.F.R. § 2200.61, provides:

> Postponement of hearing.
>
> (a) Postponement of a hearing ordinarily will not be allowed.
> (b) Except in the case of an extreme emergency or in unusual circumstances, no such request will be considered unless received in writing at least 3 days in advance of the time set for the hearing.
> (c) No postponement in excess of 30 days shall be allowed without Commission approval.

At the scheduled hearing, Judge DeBenedetto permitted the parties to present extensive arguments on the Secretary's motions. After considering these arguments, the judge denied the Secretary's motions to postpone the hearing and to permit further discovery. We conclude that the judge did not err in denying the Secretary's motions.

All parties in cases before the Commission are expected to comply with the Commission's Rules of Procedure and the orders of its judges. See, e.g., TRC Drilling Corp. (Mid-Continent Division), 81 OSAHRC 108/D10, 10 BNA OSHC 1268, 1982 CCH OSHD ¶ 25,837 (No. 80-6008, 1981). Commission Rule 61(b) clearly states that a motion to postpone a hearing must be received at least three days before the hearing unless the moving party shows that there is "an extreme emergency" or there are "unusual circumstances." We conclude that the three reasons given by the Secretary for his motion, as set forth above, do not establish the existence of "an extreme emergency" or "unusual circumstances" so as to excuse his failure to timely file his motion. With regard to the Secretary's first reason, we note that no explanation was provided as to why the Secretary's counsel could not have met with Dotti at some time between October 17, the day of his discovery inspection, and October 24, the day before his previously-scheduled commitments began. Con-

cerning the Secretary's second reason, it was established at the hearing that it was the Secretary's own failure to timely request in writing the information deemed necessary by Dotti that resulted in Dotti's failure to complete his report before the scheduled hearing date. 2/ Moreover, the Secretary concedes that he was aware of the need for this information on October 22, and yet he filed no motion for postponement until nine days later. Regarding the Secretary's third reason, it was further established at the hearing that the three-week delay in the discovery inspection was caused primarily by problems Dotti encountered in mailing the signed trade-secrecy oath back to the Secretary, rather than by G.M.'s request that an oath be signed. In any event, the Secretary was aware of the delay in Dotti's discovery inspection well in advance of the hearing and yet failed to request a postponement at that time. As Judge DeBenedetto noted in his decision, no request for a postponement was made when, on October 9, the Secretary's counsel telephoned the judge for suggestions about what could be done to arrange a new discovery inspection date necessitated by the delay encountered in mailing the oath. Indeed, in a settlement conference between the Secretary and G.M. on October 23, counsel for the Secretary informed counsel for G.M. that the Secretary was prepared to try the case on November 1 and 2. 3/

II

Following the judge's denial at the hearing of the Secretary's motions to

---

2/ Dotti was informed at the time of his discovery inspection on October 17 that G.M. would not consider his request for additional information until it was submitted in writing. Nevertheless, the Secretary never submitted a written request to G.M. and he waited until October 31, the day before the hearing, to file a request for production and inspection of documents.

3/ In support of its conclusion that dismissal is not warranted in this case, the dissent claims that G.M. incorrectly represented to the Secretary's counsel at the settlement conference that the information counsel requested had already been provided in G.M.'s answers to the Secretary's interrogatories. The dissent misreads the record. According to the Secretary's counsel, in response to the Secretary's request G.M.'s counsel stated, "We won't respond in writing. I can tell you now that what we would answer is what we've already answered in the answers to your interrogatories." While it appears from further statements by the Secretary's counsel that counsel misunderstood G.M.'s response, it is clear that G.M.'s counsel did not represent that the information requested by the Secretary had already been provided.

postpone and to permit additional discovery, Judge DeBenedetto advised the Secretary's counsel: "[Y]ou better proceed with your case in chief." After the lunch break, the Secretary's counsel stated that he was unable to proceed with the Secretary's case. G.M.'s counsel then made a motion to dismiss the case "with prejudice" under Rule 41(b) of the Federal Rules of Civil Procedure. The judge granted the motion of G.M.'s counsel and closed the hearing.

In his decision, Judge DeBenedetto concluded that the Secretary's motion to postpone the hearing "comes at a time and under circumstances which convince me that it is not made in good faith." He then went on to rule that, because the Secretary did not present his case on the scheduled hearing date, the citation item and proposed penalty should be dismissed.

While a judge's dismissal of a case under Rule 41(b) should be upheld unless the judge abused his or her discretion, the scope of the judge's discretion is narrowly circumscribed by the following criterion: "[o]nly where there is a 'clear record of delay or contumacious conduct' should an action be dismissed for failure to prosecute." Federated Metals, Inc., 81 OSAHRC 58/A2, 9 BNA OSHC 1906, 1911, 1981 CCH OSHD ¶ 25,425, at p. 31,692 (Nos. 79-2255 & 79-3647, 1981). The Secretary argues on review that there was no "clear record of delay or contumacious conduct" in the instant case. We disagree. As we noted previously, the judge did not abuse his discretion by refusing to grant the Secretary's motion to postpone the hearing. Accordingly, the Secretary was obliged to proceed with his case. We conclude that the Secretary's conduct throughout this proceeding, culminating in his refusal to go forward when so instructed by the judge, constituted a pattern of conduct rising to the level of contumacy.

We recognize the competing concerns that confronted Judge DeBenedetto: (1) the public policy favoring disposition on the merits, and (2) the preservation of the integrity of Commission rules and orders and the deterrence of future misconduct by the Secretary. We conclude that under the facts of this case the balance the judge struck between these competing interests was within the range of his

discretion. See Pittsburgh Forgings Co., 82 OSAHRC 14/D13, 10 BNA OSHC 1512, 1982 CCH OSHD ¶ 25,974 (No. 78-1361, 1982)(judge's decision to vacate citation items as a sanction for the Secretary's failure to comply with discovery order did not constitute abuse of discretion).

While we conclude that the judge did not abuse his discretion in granting G.M.'s motion to dismiss under Federal Rule 41(b), we do not agree that the dismissal should be "with prejudice" and thus constitute a decision on the merits. To dismiss this case "with prejudice" would prevent the Secretary from later trying a case on the merits against G.M. for the same noise violation that is alleged here. Assuming G.M. did fail to comply with the noise standard and that it continues to do so, to dismiss "with prejudice" would therefore frustrate the remedial purpose of the Act and, in the long term, punish only the employees for the conduct of the Secretary.

Accordingly, we modify the judge's order to be a dismissal under Rule 41(b) "without prejudice." 4/ As modified, we affirm the judge's order granting the motion to dismiss and vacating the citation item and proposed penalty.

IT IS SO ORDERED.

FOR THE COMMISSION

Ray H. Darling, Jr.

Ray H. Darling, Jr.
Executive Secretary

DATED: AUG 31 1982

---

4/ Chairman Rowland does not agree that the "remedial purposes" of the Act require that dismissal in this case be without prejudice. In Chairman Rowland's view, the judge did not abuse his discretion in ordering dismissal with prejudice in the circumstances presented here. See Lopez v. Arkansas County Indep. School Dist., 570 F.2d 541 (5th Cir. 1978); Schwarz v. United States, 384 F.2d 833 (2d Cir. 1967); Hooper v. Chrysler Motors Corp., 325 F.2d 321 (5th Cir. 1963), cert. denied, 377 U.S. 967 (1964). Chairman Rowland also notes that in Pittsburgh Forgings Co., 82 OSAHRC 14/D13, 10 BNA OSHC 1512, 1982 CCH OSHD ¶ 25,974 (No. 78-1361, 1982), and TRG Drilling Corp., 81 OSAHRC 108/D10, 10 BNA OSHC 1268, 1982 CCH OSHD ¶ 25,837 (No. 80-6008, 1981), the Commission affirmed its judges' rulings vacating citation items with prejudice. Accordingly, Chairman Rowland joins in ordering dismissal without prejudice solely to form a majority disposition in this case.

COTTINE, Commissioner, dissenting:

This case does not involve contumacious conduct on the part of the Secretary's counsel. Nor does the Secretary's late filing of the motion to postpone the hearing justify dismissal. Accordingly, dismissal of the Secretary's citation is judicial overreaction to the circumstances of this case.

I

The legal standards governing dismissal for failure to prosecute were recently stated by this Commission:

> Only where there is a "clear record of delay or contumacious conduct" should an action be dismissed for failure to prosecute. Reizakis v. Loy, 490 F.2d 1132, 1135 (4th Cir. 1974), citing and quoting Durham v. Florida East Coast Railway Co., 385 F.2d 366, 368 (5th Cir. 1957). Dismissal is justified where there is a "drawn-out history of the litigation" which demonstrates that the prosecuting party has been "deliberately proceeding in a dilatory fashion." Link v. Wabash Railroad Co., 370 U.S. 626, 633 (1962).

Federated Metals, Inc., 81 OSAHRC 58/A2, 9 BNA OSHC 1906, 1911, 1981 CCH OSHD ¶25,425 at p. 31,692 (Nos. 79-2255 & 79-3647, 1981)(footnote omitted). Under Federated Metals, only deliberate misconduct justifies dismissal for failure to prosecute. Unintentional delay is not enough. See also Ralston Purina Co., 79 OSAHRC 81/E6, 7 BNA OSHC 1730, 1979 CCH OSHD ¶23,897 (No. 78-145, 1979).

The Secretary's counsel failed to gather the information necessary to try the alleged noise violation in time for the hearing. Realizing that fact at the last moment, counsel filed a motion to postpone the hearing and a motion for production of the necessary documents by GM. There is no indication that the delays or motions were the result of a contumacious attitude and the majority points to no such evidence.

There is no evidence of intentional misconduct based on the mere series of mishaps that delayed the Secretary's discovery inspection

until October 17. Nor does the fact that the Secretary's counsel did not learn about the need for additional information until 5 days after that inspection indicate contumacy. The necessary information was requested from GM's counsel during a settlement meeting the next day (October 23) and counsel was informed that it had been included in GM's answers to interrogatories. This incorrect representation contributed to the delay in seeking a postponement of the hearing (the expert was unavailable for consultation after October 24). Thus, the further eight-day delay by the Secretary's counsel in seeking a postponement and requesting the needed information is understandable and does not indicate contumacious behavior.

The Commission repeatedly has faced the problem of delays in noise cases due in part to the lack of expeditious, thorough discovery by the Secretary. E.g., Samsonite Corp., 10 BNA OSHC 1583, 1982 CCH OSHD ¶26,054 (No. 79-5649, 1982); Federated Metals, supra; Ralston Purina, supra. Extensive and complex discovery generally is involved where the feasibility of engineering controls to reduce noise exposure is in issue. See Del Monte Corp., 81 OSAHRC 78/A2, 9 BNA OSHC 2136, 1981 CCH OSHD ¶25,586 (No. 11865, 1981); Federated Metals, supra; Ralston Purina, supra. There is no basis for finding that the delays and errors in this case were any more deliberate than those in the noise cases cited above.

Shortly before the hearing the Secretary's counsel met with her supervisor and they determined that they could not try the case without more information. They did the only thing possible short of dropping the case-- they filed a motion to postpone the hearing and a motion for the production of documents. The judge did not clearly order the Secretary to proceed with his case. The judge's comment, "you better proceed with your case in chief" was followed by further consideration of pretrial

motions. Thereafter, the judge did not order the Secretary to proceed. Thus, there was no disobedience of an order to proceed with the Secretary's case. Moreover, the Secretary has declined to go forward with his case in similar noise cases where he lacked the necessary evidence. Del Monte, supra; Federated Metals, supra; Ralston Purina, supra. The Commission did not find that action to be contumacious.

The majority has reached out again to find contumacy on the part of the Secretary's counsel without factual support. See also TRG Drilling Corp., 81 OSAHRC 108/D10, 10 BNA OSHC 1268, 1982 CCH OSHD ¶25,837 (No. 80-6008, 1981)(Cottine, Commissioner, dissenting). This finding has another serious consequence. It casts an adverse reflection on the professional competence of an attorney. Under these circumstances the issue of contumacy must be carefully addressed and resolved in fairness to the parties and their representatives. Id.

Federated Metals indicates that dismissal is inappropriate here for another reason:

> A dismissal under Federal Rule 41(b) is a sanction against the prosecuting party. Therefore, it is not properly employed where, as here, the prosecuting party's failure to proceed is largely the defending party's fault. Fidelity Philadelphia Trust Co. v. Pioche Mines Consolidated, Inc., 587 F.2d 27 (9th Cir. 1978); United States v. Inter-American Shipping Corp., 455 F.2d 938 (5th Cir. 1972); Davis v. Romney, [53 F.R.D. 247 (E.D. Pa. 1971)].

9 BNA OSHC at 1913, 1981 CCH OSHD at p. 31,694. As noted above, the incorrect representation by GM's counsel that all additional information requested by the Secretary's counsel 9 days before the hearing had already been turned over contributed to the delay in seeking a postponement of the

hearing. 1/ Also, neither the Secretary nor the judge received GM's witness list, the list of documents GM intended to offer in evidence, or other information covered by the pre-trial order until the day of the hearing. The judge had ordered that information turned over at least a week before the hearing. The Secretary objected to the late disclosures, claiming surprise. In fairness, GM must share the responsibility for the need to postpone the hearing. Accordingly, the Secretary's case should not have been dismissed.

II

The failure by the Secretary's counsel to comply with Commission Rule 61(b) also does not justify dismissal:

> [T]he Commission and the courts of appeals that review our decisions have required a showing of actual prejudice before vacating citations for failure to follow Commission rules or orders or for failure to follow procedural provisions of the Act itself. . . .
>
> Assuming, as we do here, an absence of contumacious conduct on the part of the delaying party, we consider lack of prejudice to respondents as the controlling factor in determining that dismissal is too harsh a sanction under the circumstances.

Duquesne Light Co., 80 OSAHRC 32/B7, 8 BNA OSHC 1218, ]222, ]980 CCH OSHD ¶24,384 at 29,719 (No. 78-5034, 1980)(footnotes omitted). The majority has not found, nor could it find, that the failure to file the motion to postpone at least 3 days before the hearing was in itself a contumacious act. Nor was there any prejudice to GM, as its ability to

---

1/ Even accepting the majority's selective interpretation of the record at note 3, supra, the Secretary's counsel reasonably understood the responses of GM's counsel during the pretrial period to have suggested that the requested information had already been supplied. TR. 20, 28-9, 31. Under these circumstances, the conduct of the Secretary's counsel cannot be considered contumacious.

present its defenses was not shown to have been compromised. E.g., Rollins Outdoor Advertizing, Inc., 77 OSAHRC 24/C1, 5 BNA OSHC 1041, 1977-78 CCH OSHD ¶21,551 (No. 12528, 1977); Accu-Namics, Inc., 74 OSAHRC 35/A2, 1 BNA OSHC 1751, 1974-75 CCH OSHD ¶17,936 (No. 477, 1974), aff'd, 515 F.2d 828 (5th Cir. 1975), cert. denied, 425 U.S. 903 (1976).

There are no grounds for dismissal in this case under Commission precedent. Accordingly, the judge's action in dismissing the citation should be reversed and the case remanded for further proceedings.

|---|---|
| SECRETARY OF LABOR,<br><br>Complainant,<br><br>v.<br><br>FISHER BODY DIVISION OF GENERAL MOTORS CORPORATION,<br><br>Respondent. | OSHRC DOCKET<br><br>NO. 79-2212 |

RULING ON RESPONDENT'S MOTION TO DISMISS
UNDER RULE 41(b) OF FEDERAL RULES OF CIVIL PROCEDURE

On April 2, 1979, respondent was cited for violating section 5(a)(2) of the Occupational Safety and Health Act of 1970 (the Act), 29 U.S.C. § 654(a)(2), by failing to comply with various general industry safety and health standards, including the occupational noise standard of 29 C.F.R. § 1910.95(b)(1) [item 1 of citation number 2]. The parties entered into a settlement agreement on November 1, 1979, which resolved all matters except the charge of violating the noise standard, for which a $100.00 penalty is proposed by the Secretary.[1/] The remaining contested noise-standard allegation is the subject of respondent's motion to dismiss for failure of the Secretary to prosecute.

Inspection of respondent's plant in West Trenton, New Jersey, took place during the period from February 12 to March 22, 1979.

---

1/ The matters settled by the parties were severed from the instant proceeding by Order approving the settlement agreement entered on December 19, 1979.

The Secretary apparently found, in two departments of the plant, excessive noise levels emanating from several presses and roll mills. The complaint was filed on June 11, 1979. It was signed by attorney Helen Maher. The complaint was answered in June, and on August 15, 1979, a notice of hearing was sent to the parties setting November 1 and 2, 1979, as the hearing dates.

Both parties conducted discovery by written interrogatories; respondent filed its request for interrogatories in July 1979, and the Secretary had until September 21, 1979, to respond to the interrogatories. The Secretary, through attorney Helen Maher, filed his interrogatory request on September 11, 1979, and respondent had until October 19, 1979, to respond to the interrogatories. The Secretary's expert witness, Norman Dotti, conducted an inspection of the cited worksite on October 17, 1979 (Tr. 19). A settlement conference was held by the parties on October 23, 1979, and on October 26, 1979, Secretary's counsel, Helen Maher, pursuant to the prehearing order, sent a notice of issues and a list of witnesses to be produced in the Secretary's case at the scheduled hearing.

On October 31, 1979, the day before the hearing, the Secretary filed a motion to adjourn[2/] and a request for production of

---

2/ Under the Commission's procedural Rule 61(b), 29 C.F.R. § 2200.61(b), no request for postponement of a hearing will be considered unless received in writing at least three days in advance of the time set for the hearing, "[e]xcept in the case of an extreme emergency or in unusual circumstances."

documents[3/] (both were dated October 31, 1979). Respondent and the employee representatives did not receive their copies of the motion and discovery request until the day of the hearing (Tr. 6-7). The Secretary gives the following reasons for seeking an adjournment and discovery by production of documents: (a) the Secretary's expert witness, Norman Dotti, was unavailable to meet with Secretary's counsel prior to the November first hearing date because of "previously scheduled commitments out of town from Thursday, October 25, 1979, through to November 1, 1979"; (b) Norman Dotti had been unable to prepare a full report because of the lack of necessary information -- a problem which, according to the Secretary, Dotti disclosed to Secretary's counsel on October 22; (c) the November first hearing date was "originally acceptable based on an understanding that the Secretary's expert would conduct his discovery inspection" by September 24, 1979, but because of a three-week delay in that inspection (due to problems encountered in mailing a trade-secrecy oath (Tr. 8, 39)), "the preparation period for the Secretary diminished significantly."

What is strikingly at odds with the foregoing reasons given by the Secretary in its application for an adjournment are the following undisputed facts: Helen Maher, the Secretary's attorney of record who handled the case since commencement of the action,

---

3/ Request for production of documents is governed by Fed. R. Civ. P. 34, which is made applicable to Commission proceedings by 29 C.F.R. § 2200.2(b):

> In the absence of a specific provision, procedure shall be in accordance with the Federal Rules of Civil Procedure.

assured respondent's counsel as late as October 23, 1979, that the Secretary was prepared to go forward on the scheduled date of hearing (Tr. 31); the Secretary's October 26, 1979, prehearing notice of issues and list of witnesses (J-11) did not suggest that there might be need for a continuance; Secretary's counsel had indeed intended to present the Secretary's case at the hearing set for November first until "[t]here was a discussion held in our office and it was decided that we had not had the necessary information to go on" (Tr. 33, 41) -- that discussion took place on Tuesday, October 30, 1979, just two days before the scheduled hearing.

Further undermining the Secretary's position is his application for production of documents. It is significant to note the general nature of the Secretary's requests. Merely to state them is to show that they are so manifestly broad in scope as to be suitable to any occupational noise case in which engineering and administrative controls are at issue. Here, for example, are the first four of the Secretary's requests:

> 1. All documents relating to the results of sound level measurements taken in respondent's premises at the cited locations during the years 1965 through 1979 inclusive.
>
> 2. All documents pertaining to any and all studies, investigations, or evaluations of the feasibility of engineering controls for the purpose of reducing noise levels, exposure to noise, or the time of employee exposure to noise in the premises at the cited locations.

3. All documents pertaining to any and all studies, investigations, or evaluations of the feasibility of administrative controls for the purpose of reducing noise levels, exposure to noise, or the time of exposure of employees to noise in the premises at the cited locations.

4. All writings submitted to the respondent by any person or firm which pertain to any study, investigation or evaluation of the feasibility of engineering controls for the purpose of reducing noise levels, exposure to noise, or the time of employee exposure to noise in the premises at the cited locations.

Such requests, which have been seen before by the undersigned in a number of other cases, have heretofore been routinely made by Secretary's counsel at the same time interrogatories were directed to the employer -- far in advance of the date set for hearing. Considering the general nature of the requests, it is somewhat anomalous for Secretary's counsel to state that he was "only interested in what Mr. Dotti requested" and that the request for production of documents was an "attempt to move as expeditiously as possible" (Tr. 30). Mr. Dotti indicated that he needed information concerning "die changes and press loading." When Secretary's counsel was asked where those articles appeared among the items listed in the requests for production of documents, the following exchange occured (Tr. 46):

JUDGE DE BENEDETTO: But I mean is it included in the Request for Production of Documents?

MR. SCOTT [counsel assisting Helen Maher during the hearing]: Yes.

JUDGE DE BENEDETTO: What item is that?

MR. SCOTT: Not for die change, it was the audiometric testing --

JUDGE DE BENEDETTO: No, I'm referring to die changes and press loading.

MR. SCOTT: No. I don't think that that specifically appears. We asked for the engineering studies.

JUDGE DE BENEDETTO: Would that appear in the engineering studies?

MR. SCOTT: My expert advises me that he believes it would. He said it's part of the economic analysis data.

If the requests for documents were made only after thoughtful consideration and grounded on the specific needs of the Secretary's expert witness, as Secretary's counsel suggested(Tr. 30, 47-48), I should think the requests would have been drafted with a greater degree of specificity. What should also be noted is that while at one point Secretary's counsel professed to have waited until it was ascertained whether respondent actually had the documents before requesting them (Tr. 48), at another point Secretary's counsel indicated that there might be documents listed among the requests that respondent may not possess (Tr. 49-50).

It is recognised that the discretionary power to dismiss for want of prosecution should be used sparingly and that the policy of law favors disposition of litigation on the merits.

However, the Secretary had ample opportunity to apply to the undersigned for whatever relief the Secretary may have been entitled to.[4/] The motion for adjournment comes at a time and under circumstances which convince me that it is not made in good faith. Secretary v. Ralston Purina Co., No. 78-145 (September 26, 1979) CCH OSHD para. 23,897.

The Secretary having failed to present his case at the November 1, 1979, hearing, respondent's motion to dismiss the case with prejudice under Fed. R. Civ. P. 41(b)[5/] for failure to prosecute is granted, and the Secretary's motion for an adjournment is denied. Accordingly, it is

ORDERED that item 1 of citation number 2 and the $100.00 penalty proposed therefor are vacated.

Richard DeBenedetto
RICHARD DeBENEDETTO
JUDGE, OSHRC

Dated: December 19, 1979
New York, New York

---

4/ On one occasion, in a telephone conversation with the undersigned on or about October 9, 1979, Secretary's counsel indicated that there was a problem in arranging the expert's visit to respondent's plant as planned due to the trade-secrecy oath mailing mishaps. The undersigned suggested a course of action which aided in a resolution of the problem. At no time during this conversation did Secretary's counsel request a continuance (Tr. 38-39, 57-58).

5/ Fed. R. Civ. P. 41(b) states in part:

> For failure of the plaintiff to prosecute . . . a defendant may move for dismissal of an action or of any claim against him . . . Unless the court in its order for dismissal otherwise specifies, a dismissal under this subdivision . . . operates as an adjudication upon the merits.

| SECRETARY OF LABOR,<br><br>Complainant,<br><br>v.<br><br>HEARST CORPORATION,<br>PEJEPSCOT PAPER CORPORATION,<br><br>Respondent,<br><br>UNITED PAPERWORKERS INTERNATIONAL UNION,<br>LOCAL No. 23,<br><br>Authorized Employee<br>Representative. | OSHRC Docket No. 80-6051 |

ORDER OF REMAND

Before: ROWLAND, Chairman; CLEARY and COTTINE, Commissioners.

BY THE COMMISSION:

The Secretary of Labor and Hearst Corporation submitted a settlement proposal to Administrative Law Judge Richard J. DeBenedetto. The judge approved the settlement proposal, finding in part that the United Paperworkers International Union Local No. 23 had been afforded "adequate notice." We find that the union was not afforded the opportunity to respond that it was entitled to under the Commission's rules. We therefore vacate the judge's decision and remand for consideration of the union's objections to the settlement proposal.

The Commission's rules of procedure afford representatives of affected employees a ten-day period for objecting to a settlement proposal. 1/ Although

1/ Commission Rule 100(c), 29 C.F.R. § 2200.100(c). This requirement applies whether a union is a party or not. If, as here, a union is a party, it is

(cont'd)

this period begins to run from the day the proposal is served on a union, [2/] our rules contemplate that service on a union would be simultaneous with the filing of the proposal with the judge or the Commission. [3/] In this way, a union served with a settlement proposal that has been filed with a judge or the Commission would understand that its ten-day period for filing an objection is running.

The union in this case was twice served with a settlement proposal far more than ten days before a settlement proposal was either filed with or approved by the judge. However, the letters to the union representatives that accompanied the proposal they received did not give them any notice that the proposal would be filed with the judge for approval if the union failed to object. [4/] Weeks later, when the proposal was filed with the judge, it was evidently not served

---

(Footnote 1 cont'd)

in any event entitled to a 10-day response period under Commission Rule 37, 29 C.F.R. § 2200.37 (response to motions); American Cyanamid Co., 80 OSAHRC 40/C8, 8 BNA OSHC 1346, 1348, 1980 CCH OSHD ¶ 24,424, p. 29,791 (No. 77-3752, 1980)(filed settlement proposal is in the nature of a motion), rev'd on another ground sub nom. Marshall v. Oil, Chemical & Atomic Workers Int'l Union, 647 F.2d 383 (3d Cir. 1981). This period is extended by three days when the union has been served by mail. Commission Rule 4(b), 29 C.F.R. § 2200.4(b).

2/ Commission Rules 37 and 100(c), 29 C.F.R. §§ 2200.37 and 2200.100(c).

3/ Commission Rules 7(a) and 100(c), 29 C.F.R. §§ 2200.7(a) and 2200.100(c). See American Cyanamid, note 1 supra.

4/ The letters to the union representatives stated:

> Enclosed please find a copy of the Settlement Agreement in this case. Union acceptance of settlement agreements is now requested, and we will therefore appreciate your signature and title on the last page of the agreement. The agreement has already been explained to union representatives who have called this office. After signing it, please return it to this office for filing with the Administrative Law Judge.

on the union and it was not accompanied by a certificate of such service. 5/ In short, there is no evidence that the union knew that its ten-day period for filing objections had begun.

Accordingly, the judge's decision is vacated and the case is remanded for consideration of the union's objections to the settlement proposal. We also call the parties' and the judge's attention to our recent decision in Mobil Oil Corp., 82 OSAHRC _____, 10 BNA OSHC _____, 1982 CCH OSHD ¶ _____ (No. 77-4386, 1982). 6/

SO ORDERED.

FOR THE COMMISSION

Ray H. Darling, Jr.

Ray H. Darling, Jr.
Executive Secretary

DATED: AUG 31 1982

---

5/ See Commission Rule 7(d), 29 C.F.R. § 2200.7(d)(proof of service, stating date and manner of service, must accompany filed document). Although the settlement proposal was posted, this is not sufficient service upon represented employees. See Commission Rules 100(c) and 7(h), (f) and (c); Asarco, Inc., 80 OSAHRC 104/F5, 8 BNA OSHC 2200, 1980 CCH OSHD ¶ 24,913 (No. 79-5557, 1980).

6/ For the reasons explained in his dissenting opinion in Mobil, the Chairman believes that consideration of the settlement agreement should be limited to any objections the union may have to the reasonableness of the abatement period agreed upon by the Secretary and Hearst.

| v. | : | OSHRC DOCKET NO. 80-6051 |
| THE HEARST CORPORATION, PEJEPSCOT PAPER DIVISION, | : | |
| Respondent | : | |

## ORDER

On September 8, 1980, respondent was cited for allegedly seriously violating the general duty clause of section 5(a)(1) of the Occupational Safety and Health Act of 1970 (the Act), 29 U.S.C. §654(a)(1), and the specific duty clause of section 5(a)(2) of the Act, 29 U.S.C. §654(a)(2), by failing to comply with several health standards, designated in the citation as items 1a, 1b, 2, 3, 4 and 5. The Secretary proposes that penalties be assessed totaling $1,600 (as amended on September 30, 1980). Respondent contested the matter.

The parties entered into a settlement agreement whereby the Secretary has moved to: withdraw items 1a and 2; delete certain words from item 4; modify the abatement dates for certain specified items; and reduce the proposed penalty from a total of $1,600 to $510. In consideration thereof, respondent has moved to withdraw its notice of contest and has agreed to take certain specified abatement actions.

The record reflects (1) abatement of the violations has been or will be accomplished at a specified time; (2) assurance of continuing compliance by respondent; (3) payment of the amended proposed penalty; and (4) adequate notice to affected employees.

The settlement agreement being in accord with the purposes and objectives of the Act, it is approved and the motions are granted. Respondent's notice of contest is dismissed. Items 1a and 2 are vacated, the remaining items of the citation are amended to conform to the terms of the settlement agreement, the citation is affirmed, as amended, and a total penalty of $510 is assessed.

## DECISION

Before ROWLAND, Chairman; CLEARY and COTTINE, Commissioners.

COTTINE, Commissioner:

A decision of Administrative Law Judge Edward V. Alfieri is before the Commission for review pursuant to section 12(j), 29 U.S.C. § 661(i), of the Occupational Safety and Health Act of 1970, 29 U.S.C. §§ 651-678 ("the Act"). Judge Alfieri approved a settlement agreement between the Secretary of Labor ("the Secretary") and Mobil Oil Corporation ("Mobil Oil" or "the Company") without considering the objections raised by the affected employees through their authorized employee representative, the Petroleum Trades and Employees Union, Local 419 ("the P.T.E.U." or "the Union"). The judge concluded that the P.T.E.U. lacked standing to challenge the sufficiency of the abatement plan included in the settlement agreement. The Commission reverses the judge's decision, declines to approve the settlement agreement, and remands the case for further proceedings.

I

On November 30, 1977, the Secretary issued a citation to Mobil Oil alleging a serious violation of section 5(a)(1) of the Act, 29 U.S.C. § 654(a)(1),[1/] at the company's petroleum tank storage facility on Staten Island, New York. The citation concerned the required method used by the bulk plant men to perform manual gauging and sampling of petroleum stored in floating roof tanks. Specifically, the allegations were that these employees were required "to descend onto the roof of said tank(s) without any tests being taken of the potentially toxic/combustible atmospheres into which they are required to enter" and "to perform their task alone when the floating roof(s) were ten (10) feet or more below the tank(s) shell." Lack of adequate training was also alleged. Immediate abatement was required and a $540 penalty was proposed.

Mobil Oil contested the citation and proposed penalty and a hearing was scheduled before Judge Alfieri. However, prior to the hearing the judge learned that the Secretary and Mobil Oil had settled the case. He therefore canceled the hearing and directed the parties to file their agreement.

Before the parties responded, the P.T.E.U. elected party status on behalf of the affected employees. The judge ordered service of all documents on the P.T.E.U. Shortly thereafter, the Secretary notified Mobil Oil that the settlement agreement would not be filed and that the settlement negotiations should continue. The Secretary stated that his reconsideration of the proposed abatement plan included in the agreement revealed that it did not best provide for employee safety because the plan was based on outdated material.

---

1/ This section provides that "[e]ach employer...shall furnish to each of his employees employment and a place of employment which are free from recognized hazards that are causing or are likely to cause death or serious physical harm to his employees."

Mobil Oil objected but also continued settlement negotiations. As a result, the Secretary and Mobil Oil reached a second agreement and, on May 18, 1978, the Secretary sent a copy of this agreement to Mobil Oil for signature and service on affected employees. On May 25, 1978, a general objection to the settlement was filed with the judge by the P.T.E.U. The Union also requested "a formal hearing so that we can press our viewpoint on this matter as we have not participated in any discussions because of no notice to us." In view of this response, Judge Alfieri held a prehearing conference for all parties on May 31, 1978. At the hearing the Secretary and Mobil Oil submitted a signed copy of the second settlement agreement. The judge then scheduled a hearing for June 6, 1978, on whether he should approve the settlement agreement.

The proposed abatement plan incorporated into the second settlement agreement pertains to gauging procedures for floating roof tanks during two defined times: "detector alarm conditions" and the time after detector alarm conditions ("less critical period"). Detector alarm conditions exist while the floating roof of the tank is being refloated and for four hours thereafter. During this time, Mobil Oil is required, among other things, to have immediately available at the tank gauging platform a second person to maintain visual contact with the gauger on the floating roof performing manual gauging and sampling of petroleum. During the less critical period, Mobil Oil is required only to have available at the terminal a second person to maintain radio contact with the gauger while he performs his tasks, first when he arrives at the top of the tank and then every ten minutes thereafter. If at any time the second person cannot make contact with the gauger, then he must proceed immediately to the tank after alerting a third backup person.

At the hearing, the P.T.E.U. argued that the proposed abatement plan is insufficient because of the provision for ten-minute radio contact between the

gauger and a second person during the less critical period. The Union asserts that the gauger's safety requires an immediately available second person maintaining visual contact with the gauger at all times. In response, Judge Alfieri stated that this objection could not be heard. Noting Commission precedent,[2/] the judge stated that the Commission had interpreted section 10(c) of the Act, 29 U.S.C. § 659(c), to limit employees' objections in Commission proceedings to the reasonableness of the abatement period. The judge specified that objections to the sufficiency of the abatement plan must be tied to an objection to the abatement time. Because immediate abatement is required in this case, the Union conceded that its objection could not be framed in terms of an objection to the abatement time. The Secretary and Mobil Oil at this point asserted that, in view of their agreement that the abatement plan was sufficient and the Union's lack of standing to object to the sufficiency of the settlement agreement, the agreement should be approved. Accordingly, Judge Alfieri denied further hearing on the Union's objections.

In his decision issued on July 6, 1978, Judge Alfieri affirmed his rulings at the hearing. He therefore approved the settlement without consideration of the P.T.E.U.'s objections. Consistent with the agreement, he affirmed the citation and assessed a $400 penalty.

II

The P.T.E.U. filed a letter objecting to the judge's order and I directed review of the case.[3/] The P.T.E.U. argues on review that the Commission's

---

2/ United Automobile Workers, Local 588 (Ford Motor Co.), 76 OSAHRC 58/B8, 4 BNA OSHC 1243, 1976-77 CCH OSHD ¶ 20,737 (No. 2786, 1976), aff'd, 557 F.2d 607 (7th Cir. 1977); Southern Bell Telephone & Telegraph Co., 77 OSAHRC 83/D1, 5 BNA OSHC 1405, 1977-78 CCH OSHD ¶ 21,840 (No. 10340, 1977).

3/ In its letter, the Union stated that it would file a petition for review and indicated the grounds on which it objected to the judge's

(Continued on next page)

interpretation of section 10(c) of the Act, on which the judge relied, is unduly narrow in light of the plain language of the last sentence of the section: "[t]he rules of procedure prescribed by the Commission shall provide affected employees or representatives of affected employees an opportunity to participate as parties to hearings under this subsection." The P.T.E.U. further argues that the Commission's interpretation limiting employee challenges to the abatement time is inconsistent with the purpose and objectives of the Act. According to the Union, the result of the narrow interpretation is to exclude the Act's beneficiaries, the employees, from any meaningful role in achieving appropriate abatement of workplace hazards.

On review, the Secretary and Mobil Oil support the judge's decision. Both argue that the decision comports with established Commission precedent, and Mobil Oil extensively argues that the precedent is fully consistent with the Act's purpose and objectives. Briefly stated, Mobil Oil's reasoning is

---

3/ (continued)

order. I regarded the letter as a petition for review and directed review on the issues raised by the Union, stating the following specific issues:

> 1) Whether the judge erred in concluding that the Authorized Employee Representative may not challenge the sufficiency of abatement in terms of the reasonableness of the abatement period under 29 U.S.C. § 659(c).
>
> 2) Whether the Judge erred in approving the settlement agreement filed by the Secretary and the Respondent without considering the objections raised by the Authorized Employee Representative.
>
> 3) Whether the settlement agreement approved by the Judge is consistent with the provisions and objectives of the Act.

Mobil Oil contends that the P.T.E.U.'s petition for discretionary review and the direction for review are both invalid. However, Commission

(Continued on next page)

that strictly clear and narrow limitations on the employees' role in the enforcement proceedings are necessary to preserve the Secretary's authority to enforce the Act in a manner that is consistent with the varying demands of the public interest. Both parties additionally argue that their settlement agreement should be approved because the abatement plan included in it effectuates the Act's goal of abatement of workplace hazards.

This opinion addresses these issues in terms of the statutory right of party status conferred by section 10(c) of the Act (Part III) and the settlement agreement offered for Commission approval (Part IV). It is concluded that the Act independently creates a right to contest the citation distinct from the absolute right afforded employees to participate in

---

3/ (continued)

Rule 91a(d), 29 C.F.R. § 2200.91a(d), now redesignated Rule 92(d), 29 C.F.R. § 2200.92(d), provides:

> At any time within 30 days after the filing of a decision of a judge, a case may also be directed for review by a member [of the Commission] upon his own motion upon any ground that could be raised by a party, but the issues would normally be limited to novel questions of law or policy or questions involving conflict in Administrative Law Judges' decisions. Any direction for review shall state the issues with particularity. Except in extraordinary circumstances, the Commission's power to review is limited to issues of law or fact raised by the parties in the proceedings below.

Because a Commission member can on his own motion direct review of any issues that could be raised by a party, Mobil Oil's arguments as to why the P.T.E.U.'s petition for review is defective need not be considered. As long as the direction for review is independently valid, the issues set forth in it are before the Commission for review regardless of a defect in the petition.

Clearly the direction for review is valid. Contrary to Mobil Oil's contention, the issues stated in the direction for review apprise the parties of the issues the Commission intends to review. These issues are inherent in the objections of the P.T.E.U. raised in the proceedings below, and they present substantial questions of law. The direction for review is therefore consistent with Rule 92(d).

Commission proceedings (Parts III A & B) and that the Commission adopted appropriate rules of procedure implementing this statutory framework (Part III C). In addition, the statute is interpreted as a whole to confer rights on employees that are independent of, though interrelated with, the Secretary's enforcement authority (Part III D) and that the Commission majority erred in United States Steel Corp., 77 OSAHRC 12/C3, 4 BNA OSHC 2001, 1976-77 CCH OSHD ¶21,463 (No. 2975, 1977), by limiting employee party status to the "reasonableness of the abatement period" (Part III E). In considering employee objections to a settlement agreement, a reasonable balance is struck if a settlement agreement is approved over the objections of the participating employees provided the settlement satisfies certain minimum conditions (Part IV A & B). Finally, the abatement method and abatement period are inextricably intertwined and employee objections to an abatement plan must be considered in determining whether the mini mum conditions for approval have been satisfied (Part IV C).[4/]

---

4/ Several courts of appeals have considered these and related issues and reached contrary conclusions. See text and nn. 23, 25, 29, 34, infra. Nevertheless, the Commission adheres to its longstanding and often-stated view that an administrative agency charged with the duty of formulating uniform and orderly national law for these adjudications is not bound to acquiesce in the views of the United States courts of appeals that conflict with those of the agency. Consistent application of Commission rules of procedure is also essential to maintain the procedural regularity required for efficient administration of Commission proceedings. Certainly, the Commission gives due deference to the views of the circuits. However, the Commission is obligated to establish and follow its own precedent in carrying out its adjudicatory functions under the Act unless that precedent is reversed by the United States Supreme Court. Raybestos Friction Materials Co., 80 OSAHRC 111/E14, 9 BNA OSHC 1141, 1980 CCH OSHD ¶24,910 (No. 80-2793, 1980); Farmer's Export Co., 80 OSAHRC 66/A2, 8 BNA OSHC 1655, 1980 CCH OSHD ¶24,569 (No. 78-1708, 1980); S&H Riggers & Erectors, Inc., 79 OSAHRC 23/A2, 7 BNA OSHC 1260, 1979 CCH OSHD ¶23,480 (No. 15855, 1979), rev'd on other grounds, 659 F.2d 1273 (5th Cir. 1981); Grossman Steel & Aluminum Corp., 76 OSAHRC 54/D9, 4 BNA OSHC 1185, 1975-76 CCH OSHD ¶20,691 (No. 12775, 1976).

III

Analysis of these issues necessarily begins with the language of the statute. E.g., American Textile Manufacturers Institute, Inc. v. Donovan, 101 S.Ct. 2478, 2490 (1981). In full, section 10(c) of the Act provides:

> If an employer notifies the Secretary that he intends to contest a citation issued under section 658(a) of this title or notification issued under subsection (a) or (b) of this section, or if, within fifteen working days of the issuance of a citation under section 658(a) of this title, any employee or representative of employees files a notice with the Secretary alleging that the period of time fixed in the citation for the abatement of the violation is unreasonable, the Secretary shall immediately advise the Commission of such notification, and the Commission shall afford an opportunity for a hearing (in accordance with section 554 of Title 5 but without regard to subsection (a)(3) of such section). The Commission shall thereafter issue an order based on findings of fact, affirming, modifying, or vacating the Secretary's citation or proposed penalty, or directing other appropriate relief, and such order shall become final thirty days after its issuance. Upon a showing by an employer of a good faith effort to comply with the abatement requirements of a citation, and that abatement has not been completed because of factors beyond his reasonable control, the Secretary, after an opportunity for a hearing as provided in this subsection, shall issue an order affirming or modifying the abatement requirements in such citation. The rules of procedure prescribed by the Commission shall provide affected employees or representatives of affected employees an opportunity to participate as parties to hearings under this subsection.

29 U.S.C. § 659(c).

A

The Commission's adjudicatory jurisdiction is invoked under section 10(c) when a notice of contest is filed by either the cited employer or affected employees. The interests of a party in contesting the Secretary's citation are specified in the statute. An employer may contest the

entire citation, i.e., the existence of a violation, its classification and associated penalties, and the abatement period.[5/] Similarly, employees may contest the citation "alleging that the period of time fixed in the citation for the abatement of the violation is unreasonable." Both the employees' and the employer's right to initiate Commission proceedings by a notice of contest is included in the same clause. The adverse interests of the employers and the employees in relation to the Secretary's citation are the jurisdictional foundation for the adjudication that follows. See generally Atlas Roofing Co., Inc. v. OSHRC, 430 U.S. 442 (1977).[6/]

After a hearing opportunity has been extended to the parties, the Commission issues an order, based on findings of fact, "affirming, modifying, or vacating the Secretary's citation or proposed penalty, or directing other appropriate relief."[7/] The form of Commission adjudication is also mandated by the applicable provisions of the Administrative Procedure Act, specifically 5 U.S.C. § 554.

---

5/ See Penn-Dixie Steel Corp. v. OSHRC, 553 F.2d 1078 (7th Cir. 1977). An employer may also limit its contest to the merits of an alleged violation or the proposed penalties. See Acme Metal, Inc., 76 OSAHRC 7/B14, 3 BNA OSHC 1932, 1975-76 CCH OSHD ¶20,364 (Nos. 1811 etc., 1976).

6/ Section 10(c) also authorizes hearings on employer applications to modify the abatement requirements of a citation. See generally Commission Rule 34, 29 C.F.R. § 2200.34; Gilbert Mfg. Co., 79 OSAHRC 68/A2, 7 BNA OSHC 1611, 1979 CCH OSHD ¶ 23,782 (No. 76-4719, 1979).

7/ As a practical matter, the Commission is the original forum for adjudicating compliance with the general duty clause of the Act and

(Continued on next page)

Distinct from the contest rights which confer Commission jurisdiction, section 10(c) concludes with a Congressional direction that the rules of procedure adopted by the Commission "shall provide affected employees or representatives of affected employees an opportunity to participate as parties to hearings under this subsection." Not only is this clause granting intervening party status to the employees separate and distinct from the right to initiate Commission proceedings, it is not qualified by the earlier specific language limiting employee contests. In addition, the general reference to "hearings under this subsection" indicates that employee interests transcend those interests that might lead to an employee notice of contest. For example, the possible vacation of a citation for a hazardous condition vitally affects the statutory interests of employees whose lives, health and safety will be at risk if the condition persists in violation of the Act. Moreover, other employee rights under the Act are not limited to the abatement period even in the enforcement context. See 29 U.S.C. §§ 657(e),(f)(1).[8/] In fact, the statute directly involves employees in the entire range of administrative and judicial functions covered by the Act. See Oil, Chemical & Atomic Workers Int'l Union & Its Local 3-499 v. OSHRC (American Cyanamid Corp.), 671 F.2d 643, 647 (D.C. Cir. 1982), petition for cert. filed sub nom.

---

7/ (Continued)

the various occupational safety and health standards promulgated by the Secretary, 29 U.S.C. § 654. See Babcock & Wilcox, Co. v. Marshall, 622 F.2d 1160 (3d Cir. 1980). The only exception is the rarely invoked jurisdiction of the district court to issue injunctive relief against imminent dangers. 29 U.S.C. § 662. See Hodgson v. Greenfield & Assoc., 1 BNA OSHC 1015 (E.D. Mich. 1972). See generally Whirlpool Corp. v. Marshall, 445 U.S. 1, 8-10 (1980).

8/ See notes 26-27, infra.

American Cyanamid Corp. v. OCAW, 50 U.S.L.W. 3803 (Mar. 26, 1982) (No. 81-1784).[9/] Thus, the earlier limitation of section 10(c) regarding employee contests is unique in its reference to the abatement period. Moreover, qualifying words are to be applied to words or phrases immediately preceeding and not extended to more remote words or phrases. E.g., United States v. Pritchet, 470 F.2d 455 (D.C. Cir. 1972). "By permitting employees to elect party status, and not qualifying this status with the same limits imposed on employee initiation of Commission proceedings, it is apparent that Congress intended to continue the broad scope of employee participation in the enforcement of the Act through the adjudicative stages." Oil, Chemical & Atomic Workers Int'l Union & Its Local 3-499 v. OSHRC, 671 F.2d at 648. Accordingly, the general grant of employee party status is not qualified by the earlier qualifying language associated exclusively with employee contests.

B

Section 10(c) is unambiguous in its direction to afford employees or their representatives an opportunity to participate as parties in all Commission hearings. Congress did not leave the employees' participatory

---

9/ In standard-setting proceedings, employees and employee representatives may petition the Secretary to promulgate occupational safety and health standards, 29 U.S.C. § 655(b)(1), may participate as "interested persons" in the rulemaking proceedings, 29 U.S.C. § 655(b)(2), must be represented on any advisory committee reviewing a standard, 29 U.S.C. § 656(a)(1) and (b), and may obtain pre-enforcement judicial review of the standard, 29 U.S.C. § 655(f). In any standard providing for medical surveillance an employee may exercise a right of disclosure. 29 U.S.C. § 655(b)(7). In addition, there must be an opportunity to observe environmental and personal monitoring and access to exposure records must be provided. 29 U.S.C. § 657(c)(3).

(Continued on next page)

right to the discretion of agency rulemaking 10/ or the vagaries of

---

9/ (Continued)

An authorized employee representative may also request a health hazard evaluation by the National Institute for Occupational Safety and Health. 29 U.S.C. § 669(a)(6). Moreover, employees and employee organizations are entitled to the dissemination of information collected by NIOSH in its research, demonstrations and experiments, 29 U.S.C. § 669(d), and training and consultation shall be provided to assist in the recognition and prevention of occupational injuries and illnesses, 29 U.S.C. § 670(c).

10/ See, e.g., International Union, UAW, Local 283 v. Scofield, 382 U.S. 205, 219 n. 14 (1965). Scofield dealt with the statutory scheme for adjudicating unfair labor practice charges under section 10 of the National Labor Relations Act, 29 U.S.C. § 160, which parallels sections 9 and 10 of the Occupational Safety and Health Act, 29 U.S.C. §§ 658, 659. In NLRB proceedings, the charging party is afforded "formal recognition":

> ...he participates in the hearings as a "party"; he may call witnesses and cross-examine others, may file exceptions to any order of the trial examiner, and may file a petition for reconsideration to a Board order, 28 Fed. Reg. 7973 (1963), as amended, 29 CFR § 102.46 (1965). Of course, if the Board dismisses the complaint, he can obtain review as a person aggrieved, which serves the "public interest" by guaranteeing that the Board interpretation of the relevant provisions accords with the intent of Congress.

382 U.S. at 219 (footnotes omitted). See also Oil, Chemical & Atomic Workers Int'l Union & Its Local 3-499 v. OSHRC, 671 F.2d 643, 649 n.6 (D.C. Cir. 1982). In Scofield, the Court reserved ruling on the scope of intervention rights in the context of settlement agreements proposed during appellate review. 382 U.S. at 222 n.19. However, the Court observed that nothing in the record indicates that these proposed settlement agreements will be thwarted as a consequence of intervention. Id. Commission experience is consistent with the Court's observation. Affected employees and their representatives have elected party status on numerous occasions and have actively participated in the litigation of these Commission cases. See, e.g., American Cyanamid Co., 81 OSAHRC 49/A2, 9 BNA OSHC 1596, 1981 CCH OSHD ¶25,338 (No. 79-5762, 1981) (motion for summary judgment), dismissal denied sub nom. Oil Chemical & Atomic Workers Int'l Union & Its Local 3-499 v.

(Continued on next page)

intervention under the Administrative Procedure Act, 5 U.S.C. §554(c)(3)[11/]. Instead, Congress employed the legal term "party" expecting that the Commission would give the term its legal meaning. See Bradley v. United States, 410 U.S. 605 (1973); Standard Oil Co. of New Jersey v. United States, 221 U.S. 1 (1911). In contrast to an amicus curiae,[12/] a "party" is an active participant in the litigation to the full extent required for its complete determination. See Clark v. Barnard, 108 U.S. 436, 448(1883); United States v. Associated Milk Products, Inc., 394 F.Supp. 29, 41(W.D. Mo. 1975). In the context of an employer contest the Secretary is properly considered a plaintiff and the employer a defendant within the framework of the Commission Rules and the Federal Rules of Civil Procedure. Compare 29 C.F.R. § 2200.33(a)(b)(1981) with

---

10/ (Continued)

OSHRC, 671 F.2d 643 (D.C. Cir. 1982)(employee petition for judicial review under 29 U.S.C. § 660(a)), petition for cert. filed sub nom. American Cyanamid Corp. v. OCAW, 50 U.S.L.W. 3803 (Mar. 26, 1982) (No. 81-1784); Hull Pottery Co., 82 OSAHRC 18/D9, 10 BNA OSHC 1575, 1982 CCH OSHD ¶ 25,972 (No. 78-555, 1982)(trial); Mobil Oil Corp., 82 OSAHRC 19/F4, 10 BNA OSHC 1606, ___ CCH OSHD ¶___ (No. 80-6678, 1982) (trial). Objections to settlement agreements are not an invariable consequence of their intervening party status. See Part IVB, infra.

11/ Compare Citizens for Allegan County v. FPC, 414 F.2d 1125 (D.C. Cir. 1969) with City of San Antonio v. C.A.B., 374 F.2d 326 (D.C. Cir. 1967).

12/ An amicus curiae is not a "party" to the litigation, International Union, UAW, Local 283 v. Scofield, 382 U.S. 205, 209 (1965), and its arguments are not considered unless urged by a party to the litigation, e.g., United Parcel Service, Inc. v. Mitchell, 101 S.Ct. 1559, 1562 n.2 (1981); Bell v. Wolfish, 441 U.S. 520, 531 n.13 (1979).

Fed. R. Civ. P. 3, 7(a), 12(a).[13/] In a controversy between the Secretary and the employer, the employees are authorized to elect party status. 29 U.S.C. § 659(c); 29 C.F.R. § 2200.20(a). The statutory status of employees is identical to the absolute intervention afforded interested parties before other federal agencies and the courts. See Brotherhood of Railroad Trainmen v. Baltimore & Ohio Railroad, 331 U.S. 519 (1947) (absolute right to intervene under Interstate Commerce Act, which provides that representatives of employees of a carrier "may intervene and be heard in any proceeding under this Act affecting such employees"); cf. Interstate Broadcasting Co. v. United States, 286 F.2d 539 (D.C. Cir. 1960) (party in interest in broadcast license entitled to intervene in FCC proceeding as a matter of right); United States v. Ketchikan Pulp Co., 430 F. Supp. 83 (D. Alaska 1977)(citizen intervention of right in government enforcement action under Federal Water Pollution Control Act); 28 U.S.C. § 2323 (parties in interest are intervenors of right in judicial enforcement of ICC order).[14/]

---

13/ In the context of traditional two-party litigation, the contesting employer and the Secretary would be described as "principal parties" because of their adverse interests. However, litigation before the Commission frequently involves three parties, each with interests potentially adverse to the other two. In this context, the simple alignments of an earlier era do not provide "the protection needed in a modern complex society." 3B Moore's Federal Practice ¶24.02 at p. 24-32.

14/ It is crucial to distinguish between absolute intervention (intervention of right) and permissive intervention. In

(Continued on next page)

Intervention principles further aid in the interpretation of the participatory right of employee parties. See International Union, U.A.W., Local 283 v. Scofield, 382 U.S. 205 (1965). The underlying principle of intervention is that third parties are permitted to enter a controversy in order to protect interests that may be jeopardized by the

---

14/ (Continued)

absolute intervention, the status of the intervenor mandates the entry of an order granting intervention. In permissive intervention, a party's interest in the proceedings must be balanced against forum considerations, e.g., delay, before the court exercises its discretion to grant or deny intervention. Limitations on permissive intervention are not necessarily limitations on absolute intervention. As Professor Moore observed, "It would be meaningless to give him [an intervenor] an absolute right to intervene in order to protect his interest, if once in the proceeding he were barred from raising questions necessary for his own protection." 3B Moore's Federal Practice ¶24.16[4] at p. 24-631. See Park & Tillford, Inc. v. Schulte, 160 F.2d 984 (2d Cir. 1947). Professor Moore contrasts permissive intervention and concludes that when the issues introduced by the permissive intervenor unduly burden the proceeding, "[t]he remedy"...is to deny intervention, or at least to allow intervention only for limited purposes." Id. at p. 24-632. The Act precludes limitation of the absolute intervention afforded affected employees or their authorized representative.

Furthermore, the "scope" of absolute intervention is not "subordinated to the interests of the principal parties" as stated in the concurring opinion. Note 38, infra(Cleary, Comm'r, concurring). The term "subordination" has a distinct technical meaning in describing the relation between an intervenor and the original parties. Prior to the adoption of the Federal Rules of Civil Procedure, Equity Rule 37 provided:

> Anyone claiming an interest in the litigation may at any time be permitted to assert his right of intervention, but the intervention shall be in subordination to, and in recognition of, the main proceeding.

3B Moore's Federal Practice ¶ 24.05 at p. 24-75. However, that requirement was negated with the adoption of Federal Rule 24 in 1937. Id. at ¶¶24.05, 24.16.

(Continued on next page)

litigation. In contrast to an amicus curiae, an intervening party may seek protection or affirmative relief in the pending litigation. 3B Moore's Federal Practice ¶24.02 at pp.24-33 to 24-34. Thus, the plaintiff's right to exclusively control its action is limited when court process would be used to the prejudice of the rights of interested third parties. Id. at ¶24.03 at pp.24-42, 24-46 to 24-47.

Employees have a direct and personal stake in the outcome of litigation before the Commission. In fact, the personal injuries and illnesses arising out of hazardous working conditions and the consequential burden in terms of "lost production, wage loss, medical expenses, and disability compensation payments" prompted the passage of the Act. 29 U.S.C. § 651(a); S. Rep. No. 1282, 91st Cong., 2d Sess. 2-5, 54, 61 (1970), reprinted in Subcomm. on Labor, Senate Comm. on Labor & Public Welfare, The Legislative History of the Occupational Safety and Health

---

14/ (Continued)

Of course, every party's conduct is subject to the necessary limitations and restrictions imposed by the forum. E.g. Commission Rule 66, 29 C.F.R. § 2200.66. The final right to control the proceedings rests with the forum, not the parties. In addition, affected employees, authorized employee representatives, and employers participating in employee contests must elect party status before the hearing under Commission Rule 20. 29 C.F.R. § 2200.20. This is similar to the "timely application" requirement for intervention. Fed. R. Civ. P. 24(a),(b). See generally Note, The Timeliness Threat to Intervention of Right, 89 Yale L.J. 586 (1980). Election at a later time is allowed only for good cause. 29 C.F.R. § 2200.20.

Act of 1970 at 142-5, 193, 200 (1971)("Legis. History").[15/] Moreover, the affected employees have intimate contact with their working conditions, and thus may have significant information to offer regarding the alleged violations and the most appropriate form of relief. Cf. Trbovich v. United Mine Workers of America, 404 U.S. 528, 537 n.8 (1972)(interest in the formulation of post-election relief by affected employee); Brennan v. Connecticut State UAW Community Action Program Council, 60 F.R.D. 626, 630 (D. Conn. 1973)(same); United States v. Reserve Mining Co., 56 F.R.D. 408, 418-9 (D. Minn. 1972) (interest in abatement methods by environmental organization). In addition, the employees' immediate and long-term interests in a safe and healthful workplace will be determined by the Commission's order. If a violative condition is left unremedied in Commission litigation, the employees will remain exposed to the hazard. As a result, employees will be relegated to filing a new complaint with the Secretary, claiming that the conditions are hazardous notwithstanding the Commission's determination. See Marshall v. Oil, Chemical & Atomic Workers Int'l Union(IMC Chemical Group), 647 F.2d 383, 388 (3d Cir. 1981). The inefficiency of this approach is apparent — it generates the piecemeal adjudication of workplace hazards sought to be avoided by the exclusive delegation of administrative adjudication to the Commission. See generally 29

---

15/ See H.R. Rep. No. 1291, 91st Cong., 2d Sess. 14-16 (1970), Legis. History at 844-6; Whirlpool Corp. v. Marshall, 445 U.S. 1, 11-12 & n.16 (1980).

U.S.C. § 651(b)(3). Furthermore, a new employee complaint to the Secretary charging the hazardousness of the same condition is unlikely to result in a new inspection by the Secretary or re-citation in light of the prior Commission determination. The principal parties would be identical in a later contest of the subsequent citation. Accordingly, the doctrine of res judicata would bar a new action when in a prior case the Secretary had litigated an employer's specific worksite conditions to a final order that resolved the disputed legal and factual issues. See International Harvester Co. v. OSHRC, 628 F.2d 982 (7th Cir. 1980). Collateral estoppel will apply to issues actually litigated and necessarily determined in the prior case. See Continental Can Co. v. Marshall, 603 F.2d 590 (7th Cir. 1979). As a consequence, the exclusion of the intervening employees from the original contest could well preclude any further government consideration of their complaint or subsequent enforcement action.

Moreover, Congress created the Commission to hear and provide relief to parties appearing before it. It specifically withdrew adjudicatory responsibilities from the Secretary when it created the Commission as an independent agency. Amdt. No. 1061 to S.2193, 91st Cong., 2d Sess. (1970)(Sen. Javits), Legis. History at 381, amendment approved, 116 Cong. Rec. 37613 (1970), Legis. History at 479; H.R. Rep. No. 1765, 91st. Cong., 2d Sess. 13 (1970), Legis. History at 1166. 16/ Employees

---

16/ See H.R. 16785, 91st. Cong., 2d Sess. §11(b)(1970), Legis. History at 954.

were provided with an opportunity to be heard in Commission proceedings, not simply to complain to the Secretary regarding hazardous conditions. Thus, the employees' right to appear as parties before the Commission precludes returning the affected employees to the Secretary for relief that is obtainable in litigation before the Commission by the election of party status.[17/] Though the employees' participation is limited to the violations alleged by the Secretary's citation and complaint, this limitation applies only to the violative conditions and not the appropriate relief to be afforded by the Commission. See Trbovich v. United Mine Workers of America, 404 U.S. at 537 & n.8; Brennan v. Connecticut State UAW Community Action Program Council, 60 F.R.D. at 630.

Fairness and efficiency support the interpretation of section 10(c) that permits the intervening employees to participate in order to protect their statutory interest in safe and healthful working conditions. Accordingly, section 10(c) must be read to permit all parties to fully litigate the controversy initiated by the Secretary's citation so as to resolve as many of the issues as possible in one action.

---

17/ Only penalties may be mitigated by the Secretary without resort to the Commission or the courts. See 29 U.S.C. § 655(e). Reconsideration of the Commission's final order by the Secretary's examination of the employees' evidence and arguments would in fact permit the Secretary to review an order that Congress made reviewable exclusively in the courts of appeals, 29 U.S.C. § 660(a); see Atlas Roofing Co., Inc. v. OSHRC, 430 U.S. at 446-7.

C

In 1971, the Commission implemented the Congressional mandate of section 10(c) to provide affected employees or their representatives an opportunity to participate as parties to hearings under this subsection.[18/] The interim rules specifically provided that "[i]n all proceedings brought pursuant to sections 10(a), 10(b) and 10(c) of the Act, the Secretary, the employer to whom the citation, notice of proposed penalties, or notice of failure to abate has been issued, and the affected employees or authorized employee representatives shall be deemed parties...." 29 C.F.R. § 2200.5(a), 36 Fed. Reg. 17409, 17410 (Aug. 31, 1971) (Emphasis added). The equal status afforded both original and intervening parties was codified in the Commission's adoption of its permanent rule on party status in 1972. 29 C.F.R. § 2200.20, 37 Fed. Reg. 20237, 20239 (Sept. 28, 1972). This rule permitted employees to "elect" party status at any time before the commencement of the hearing. Similarly, party status was afforded to employers when employees were the contesting party. 29 C.F.R. § 2200.20(b). Thus, the specific rights of interested intervening parties were established by Rule 20 as mandated for employees by the statute and properly afforded to employers as a matter of fairness under this statutory framework for adjudication.[19/]

---

18/ The authority to adopt rules of procedure is delegated by section 12(g) of the Act, 29 U.S.C. § 661(g).

19/ In the absence of Rules 20 and 21 the Commission would have been required to conduct its proceedings in accordance with the Federal Rules of Civil Procedure. 29 U.S.C. § 661(f); 29 C.F.R. § 2200.2, 36

(Continued on next page)

D

In spite of the unconditional statutory grant of invervening party status to affected employees and the Commission's implementing rules, the Secretary argues that this statutory language should be restricted to accommodate his "prosecutorial discretion." 20/ The Secretary's argument overlooks the fundamental distinction between the initiation of enforcement proceedings and employee participation in adjudicatory proceedings. Certainly, the Secretary is granted discretion to investigate workplace hazards, issue citations, mitigate penalties and enforce the Commission's final orders, 29 U.S.C. §§ 657(a), 658(a), 655(e),

---

19/ (Continued)

Fed. Reg. 17409 (Aug. 31, 1971). Under Federal Rule 24(a)(1), the affected employees would be entitled to a statutory right to intervene based on the unconditional language of section 10(c) of the Act. See Brotherhood of Railroad Trainmen v. Baltimore & Ohio R.R., 331 U.S. 519 (1947). See generally 3B Moore's Federal Practice, ¶24.06 (1981). Similarly, the employer would be so situated that the disposition of the action may as a practical matter impair or impede its ability to protect that interest and intervention would have been permitted as of right under Federal Rule 24(a)(2). See generally 3B Moore's Federal Practice ¶¶24.05, 24.09.

The Commission rules also recognized the distinction between the absolute right of employee intervention under the statute as contrasted with other forms of intervention permitted by the rules. 29 C.F.R. §§ 2200.20, 2200.21; see Pennsylvania Truck Lines, Inc., 79 OSAHRC 79/D12, 7 BNA OSHC 1722, 1979 CCH OSHD ¶23,873 (No. 77-3050, 1979); Brown & Root, Inc., 7 BNA OSHC 1526, 1979 CCH OSHD ¶23,731 (No. 78-127, 1979).

20/ "Prosecutorial discretion" can only be defined in reference to the specific governmental authority exercised. It is not a "magical incantation which automatically provides a shield for arbitrariness." Medical Comm. for Human Rights v. SEC, 432 F.2d 659, 673 (D.C. Cir. 1970), dismissed as moot, 404 U.S. 403 (1972). Enforcement discretion is entirely dependent on the government function assigned, the range of discretion

(Continued on next page)

660(a), respectively.[21/] Moreover, the Act reserves to the Secretary the exclusive authority to initiate an enforcement action by issuing a citation under section 9 of the Act. 29 U.S.C. § 658. Employees are not authorized to issue a citation. 29 U.S.C. § 657(f)(2). Furthermore, the statute does not create any independent cause of action by affected employees against their employers for allegedly violative conditions. 29 U.S.C. § 653(b)(4); see, e.g., United Steelworkers of America v. Marshall,

---

20/ (Continued)

delegated, and the adjudicatory forum involved. Certainly, criminal proceedings involve a broad range of enforcement discretion. Compare Bordenkircher v. Hayes, 434 U.S. 357, 365 (1978) and United States v. Ammidown, 497 F.2d 615 (D.C. Cir. 1973) with Blackledge v. Allison, 431 U.S. 76 (1977) and NAACP v. Levi, 418 F.Supp. 1109 (D.D.C. 1976), dismissed as moot sub. nom. NAACP v. Bell, 76 F.R.D. 134 (D.C. Cir. 1977). However, the Commission is not a criminal tribunal. McGowan v. Marshall, 604 F.2d 885 (5th Cir. 1979); Brennan v. Winters Battery Mfg. Co., 531 F.2d 317 (6th Cir. 1975); Frank J. Irey, Jr., Inc. v. OSHRC, 519 F.2d 1200 (3d Cir. 1975), aff'd on other grounds sub nom. Atlas Roofing Co. v. OSHRC, 430 U.S. 442 (1977). The Commission is an administrative tribunal created to adjudicate specific statutory duties. Atlas Roofing Co. v. OSHRC, 430 U.S. at 455-7, 461.

Furthermore, prosecutorial discretion in civil and administrative proceedings is reviewable. Dunlop v. Bachowski, 421 U.S. 560 (1975) (reviewable: Secretary of Labor's refusal to file a complaint under the Labor-Management Reporting and Disclosure Act); Environmental Defense Fund, Inc. v. Ruckelshaus, 439 F.2d 584 (D.C. Cir. 1971)(reviewable: EPA determination not to institute a proceeding to suspend or cancel a pesticide registration); Medical Comm. for Human Rights v. SEC, supra (reviewable: SEC determination not to require inclusion of a shareholder proxy proposal); see Marshall v. Jerrico, Inc., 446 U.S. 238, 249-250 & n.11 (1980)(reviewable: prosecutorial discretion under Fair Labor Standards Act).

21/ These exercises of the Secretary's discretion are not subject to direct administrative review. Moreover, judicial review of a specific exercise of this discretion is limited. See 29 U.S.C. §662(a)(Secretary's failure to seek relief against an imminent danger reviewable in district courts); 5 U.S.C. §§ 701-706 (general judicial review provisions).

647 F.2d 1189 (D.C. Cir. 1980), cert. denied, 101 S.Ct. 3148 (1981). Thus, enforcement actions under section 9 may only be initiated by the Secretary. 22/

The citation represents the exercise of the Secretary's discretion under sections 9 and 10 of the Act. However, once a citation is issued and a contest is filed the Commission is the exclusive post-citation forum and the Secretary's exercise of enforcement discretion is the

---

22/ Though employees may not initiate enforcement proceedings, this is not inconsistent with their right to participate in those proceedings. See Trbovich v. United Mine Workers of America, 404 U.S. 528, 536-7 (1972); International Union, UAW, Local 283 v. Scofield, 382 U.S. at 221. In fact, the absence of a private right of action reinforces the necessity of the intervening party's participation in this exclusive forum.

With respect to the statutory right of action created against an employer for discriminating against an employee for exercising his or her rights under the Act, the Sixth Circuit has concluded that section 11(c) of the Act, 29 U.S.C. § 660(c), does not create an implied private right of action. Taylor v. Brighton, 616 F.2d 256 (6th Cir. 1980). The court considered the explicit provision for an alternative means of redressing this form of discrimination -- a cause of action brought by the Secretary in the United States district court -- as precluding a private civil action by the employee. Id. at 263-4. However, the absence of a private right of action with respect to retaliatory discrimination does not resolve the question of intervention in enforcement proceedings before the Commission. Congress expressly severed the two actions, assigning discrimination actions to the district courts and enforcement actions to the Commission. Compare 29 U.S.C. § 660(c) with Federal Mine Safety and Health Act Amendments of 1977, § 105(c)(2),(d), 30 U.S.C. § 815(c)(2),(d)(discrimination and enforcement actions assigned to the Federal Mine Safety and Health Review Commission).

heart of the controversy before the Commission. 23/ Parties with interests adverse to the Secretary invoke Commission jurisdiction by their notices of contest. Moreover, their adverse interests confer intervening party status in the event they do not contest the citation but another party does. Commission Rule 20(a) & (b), 29 C.F.R. § 2200.20(a) & (b)(1981).

The mere existence of enforcement discretion does not limit the statutory status of the intervening party. This is not to suggest that the Secretary is deprived of enforcement discretion but that this discretion is subject to independent review when it is involved in an enforcement action before the Commission. The interests of all parties, governmental and private, are subject to the scrutiny of adversarial adjudication and "issues cannot be resolved by a doctrine of favoring one class of litigants over another," Schlagenhauf v. Holder, 379 U.S. 104, 113 (1964). Unlike the earliest versions of the legislation which vested investigatory, enforcement and adjudicatory authority exclusively

---

23/ The court in Marshall v. Sun Petroleum Prod. Co. considered a citation to be "self-executing" under the Act. 622 F.2d 1176, 1184 (3d Cir. 1980). However, once a citation is contested it is no longer self-executing — abatement is automatically stayed during Commission proceedings unless the contest is not initiated in good faith or the contest has been filed for the sole purpose of penalty avoidance. 29 U.S.C. §§ 659(b), 666(d). In addition, a further stay of the Commission's final order is available on judicial review. 29 U.S.C. § 660(a). Thus, a citation is "self-executing" only when Commission jurisdiction has not been invoked by a notice of contest.

in the Secretary, [24/] Congress ultimately assigned adjudicatory responsibilities to the Commission under section 10 of the Act. H.R. Rep. No. 1765, 91st Cong., 2d Sess. 13(1970)(conference report), Legis. History at 1166. Here the parties' adverse interests are to be adjudicated independent of the investigatory and enforcement discretion assigned to the Secretary. See S. Rep. No. 1282, 91st Cong. 2d Sess. 63 (1970)(minority view of Sens. Dominick & Smith), Legis. History at 202. Thus, the Secretary is deprived of the power to issue an enforceable order once a notice of contest has been filed. Instead, the government must come to an adjudicatory forum to obtain an enforceable final order. See United States v. Ketchikan Pulp Co., 430 F. Supp. at 86 (analogous judicial provision of Federal Water Pollution Control Act).[25/]

24/ S.2193, 91st Cong., 1st Sess. § 6(a)(1969)(bill as originally introduced), Legis. History at 11-12; S.2193, 91st Cong., 2d Sess. § 10 (1970)(bill as reported by Senate Committee), Legis. History at 255-8; S.Rep. No. 1282, 91st Cong., 2d Sess. 14-15 (1970), Legis. History at 154-5; see text accompanying note 16, supra. Judicial review of the Secretary's enforcement orders could be obtained in the United States courts, S.2193, 91st Cong., 1st Sess. § 7(a)(1969), Legis. History at 12; S.2193, 91st Cong., 2d Sess. § 10(d), Legis. History at 258.

25/ In Oil, Chemical & Atomic Workers Int'l Union v. OSHRC (American Cyanamid Co.), the court relied on section 10(a) of the Act as the origin of the Secretary's discretion to settle cases over employee objections and reasoned that an employer's withdrawal of its notice of contest ousts the Commission of jurisdiction. 671 F.2d 643, 650 n.7 (D.C. Cir. 1982). The analysis overlooks the fact that settlements involve a wide variety of bargained-for-exchanges between the parties and do not necessarily dispose of an entire contest. Compare, e.g., Nu-Way Mobile Home Mfg., Inc., OSHRC No. 80-7082-A

(Continued on next page)

Furthermore, even in the exercise of the Secretary's investigatory and enforcement discretion, affected parties have distinct rights. Employees are explicitly permitted to file a complaint seeking inspection of a worksite hazard, 29 U.S.C. § 657(f)(1)[26/], and both employees and

---

25/ (Continued)

(May 28, 1982)(contest partially settled and severed for disposition) and Avalotis Painting Co., 81 OSAHRC 7/B1, 9 BNA OSHC 1226 n.1, 1981 CCH OSHD ¶25,157 at p. 31,055 n.1 (No. 76-4774, 1981) (partial dismissal of citation & partial withdrawal of contest) with Research Cottrell, Inc., Hamon Cooling Tower Div., 80 OSAHRC 113/F13 (No. 80-2431, 1980)(complete withdrawal of notice of contest) and Mass. Bay Electrical Corp., No. 80-5380 (Oct. 16, 1981)(complete withdrawal of citation). Furthermore, a contesting party usually seeks to withdraw its notice of contest when "the promise of another party has not led to the motion to withdraw the notice of contest." Commission Rule 100a, 29 C.F.R. § 2200.100(a). If a settlement prompts the withdrawal, the requirements of the Commission Rule on settlements must be satisfied. Id.; see Commission Rule 100, 29 C.F.R. §2200.100; cf. Fed. R. Civ. P. 23(e)(compromise or settlement of class action requires court approval); Fed. R. Civ. P. 23.1 (derivative actions); Fed. R. Civ. P. 23.2 (unincorporated associations). In either case, Commission rules specifically apply and jurisdiction is not terminated until the appropriate motion has been granted. Compare Commission Rules 100 & 100(a), 29 C.F.R. §§ 2200.100 and 100(a) with Fed. R. Civ. P. 41 and Marshall v. OSHRC (IMC Chemical Group, Inc.), 635 F.2d 544 (6th Cir. 1980)(dismissal of Secretary's complaint).

26/ Section 8(f)(1) states in relevant part:

(f)(1) Any employees or representative of employees who believe that a violation of a safety or health standard exists that threatens physical harm, or that an imminent danger exists, may request an inspection by giving notice to the Secretary or his authorized representative of such violation or danger....If upon receipt of such notification the Secretary determines there are reasonable grounds to believe that such violation or danger exists, he shall make a special inspection in accordance with the provisions of this section as soon as practicable, to determine if such violation or danger exists. If the Secretary determines there are no reasonable grounds to believe that a violation or danger exists he shall notify the employees or representative of the employees in writing of such determination.

employers are authorized to accompany the Secretary's representative during an inspection, 29 U.S.C. § 657(e).[27/] Moreover, "[i]f the Secretary determines there are no reasonable grounds to believe that a violation or danger exists he shall notify the employees or representatives of the employees in writing of such determination." 29 U.S.C. § 657(f)(1). Both the employer and employees are also entitled to be informed that an imminent danger exists and that relief will be sought. 29 U.S.C. § 662(c). In addition, affected employees may seek a writ of mandamus if the Secretary "arbitrarily or capriciously fails to seek relief" to correct an imminent danger. 29 U.S.C. § 662(d). See generally Whirlpool Corp. v. Marshall, 445 U.S. 1 (1980).

The statute read as a whole establishes a series of checks and balances on the Secretary's enforcement discretion, including Commission adjudication of contested enforcement actions. Interpreting the statute to give effect to all its provisions, see Colautti v. Franklin, 439 U.S. 379 (1979), including the provision granting party status to affected employees, the Secretary's discretion and the statutory rights of employers and employees co-exist without sacrificing the interests of the private parties to the government's unlimited enforcement discretion.

---

27/ Section 8(e) states:

> (e) Subject to regulations issued by the Secretary, a representative of the employer and a representative authorized by his employees shall be given an opportunity to accompany the Secretary or his authorized representative during the physical inspection of any workplace under subsection (a) for the purpose of aiding such inspection. Where there is no authorized employee representative, the Secretary or his authorized representative shall consult with a reasonable number of employees concerning matters of health and safety in the workplace.

E

The principal error of early Commission decisions was the failure to recognize the statutory distinction between a contesting party and an intervening party. In United States Steel Corp., 77 OSAHRC 12/C3, 4 BNA OSHC 2001, 1976-77 CCH OSHD ¶21,463 (No. 2975, 1977), the Commission majority limited the intervening party status of the employees to the "reasonableness of the abatement period." It relied on United Automobile Workers, Local 588 (Ford Motor Co.), 76 OSAHRC 58/B8, 4 BNA OSHC 1243, 1976-77 CCH OSHD ¶20,737 (No. 2786, 1976), aff'd, 557 F2d 607 (7th Cir. 1977)(hereinafter cited as UAW Local 588). 28/ Without even discussing the relevant statutory issue, the majority in United States Steel simply concluded that "[o]ur decision in United Automobile Workers, Local 588 (Ford Motor Co.) is controlling in this case...." 4 BNA OSHC at 2002, 1976-77 CCH OSHD ¶21,463 at p. 25,742. However, the literal interpretation of this language relating to employee contests has no application to the participatory rights independently established by section 10(c) with

---

28/ In UAW the Commission held that the sufficiency of a noise abatement plan established by the citation "cannot be directly contested by the union" (original emphasis) and that the Commission lacks authority to issue an order modifying an abatement plan. 4 BNA OSHC at 1244, 1976-77 CCH OSHD at p. 24,865. The holding in UAW was based on an interpretation of that provision of section 10(c) of the Act pertaining to employee notices of contest. The Commission majority concluded that employee contests and the ensuing Commission proceedings are limited to questions concerning the reasonableness of the abatement period and that employees filing a notice of contest under section 10(c) cannot challenge the sufficiency of an abatement plan except to support their position that the period of time for abatement is unreasonably long. Primary reliance for this conclusion was placed on the reference in section 10(c) to the reasonableness of the period of time, which the Commission majority viewed as a literal limitation on the employee right to contest.

respect to employer contests.[29/] Furthermore, the limitation on party participation imposed by the Commission in United States Steel leads to an anomalous result in this enforcement context. As Judge Louis H. Pollack observed:

> ...such a limitation would seem anomalous: Typically, an employer contests the Secretary's citation because the employer disputes the Secretary's finding of a violation — a finding which in many cases flows from an employee or union complaint which the Secretary is by

---

29/ In Marshall v. OSHRC(IMC Chemical Group, Inc.), 635 F.2d 544 (6th Cir. 1980), the court overlooks the party status provision entirely and states:

> 29 U.S.C. § 659(c) authorizes any employee of an employer contesting a citation issued by the Secretary to challenge as unreasonable the period of time fixed in the citation for abatement of the violation. This is the only provision in the act authorizing an affected employee to participate in OSHA proceedings before the Commission.

Id. at 551 (Original emphasis).

Similarly, in Marshall v. Sun Petroleum Prod. Co., 622 F.2d 1176 (3d Cir. 1980), the court relies exclusively on the legislative history underlying the contest rights of employees to conclude that "party status" is limited to the reasonableness of the abatement period. Id. at 1186 & nn.17&18. The court acknowledges that the employees must be considered "parties" but then concludes that employee party status is limited to the reasonableness of the abatement period because the contest right is merely a "fail-safe mechanism to insure employees the opportunity for a hearing" and is "operative only when the employer has not contested the citation and a hearing is desired by the employee or his representative." 622 F.2d at 1186 (Emphasis added). See also Marshall v. Oil, Chemical & Atomic Workers Int'l Union, 647 F.2d 383 (3d Cir. 1981). In other words if the employees want to guarantee their right to a hearing on the citation they must file a notice of contest within fifteen working days. It seems unlikely that Congress would require the employees to actively initiate the Commission's jurisdiction when their only intention is to be heard if their employer decides to invoke Commission jurisdiction. Party status protects their interest in the Commission proceedings without unnecessarily burdening the Commission with cases unless the employees have a specific claim that the abatement period is unreasonable.

> statute required to inquire into. And it would, indeed, be odd if the words of Section 10(c) precluded employees from pursuing at the adjudicative phase of OSHA enforcement the interests the Act encourages them to monitor at the investigative phase [footnote omitted].

Marshall v. Sun Petroleum Prod. Co., 622 F.2d 1176, 1189 (3rd Cir. 1980)(concurring in part & dissenting in part). Accordingly, Commissioner Cleary and I overrule United States Steel Corp., supra, to the extent it held that the employees' party status is statutorily limited to the "reasonableness of the abatement period."

IV

After electing party status in this proceeding, the Union has objected to a bilateral settlement agreement concluded between the Secretary and the Respondent. The P.T.E.U. claims the abatement plan contained in the agreement is insufficient.

A

The Commission rules specifically encourage parties to resolve the controversy presented by a contesting party through a settlement acceptable to all parties provided certain minimum conditions are satisfied. 29 C.F.R. § 2200.100 (1981). The interim rules had provided that "[i]f all parties agree, settlement will be allowed at any stage of the proceeding." 29 C.F.R. § 2200.23, 36 Fed. Reg. 17409, 17414 (Aug. 31, 1971)(Emphasis added). However, in 1972, the rule on settlements was amended to simply provide that "[s]ettlement is encouraged at any stage of the proceedings where such settlement is consistent with the provisions and objectives of the Act "...and that "[s]ettlement agreements submitted by the parties shall be accompanied by an appropriate proposed order." 29 C.F.R. §§ 2200.100(a), (b), 37 Fed. Reg. 20237, 20242 (Sept. 28, 1972).

Notwithstanding the advantages of a settlement agreed to by all parties, it is inevitable in any multi-party litigation that a settlement may be acceptable to some but not all of the parties, United States v. Ketchikan Pulp Co., 430 F.Supp. at 85, or that a party may not sign the agreement for reasons unrelated to the litigation, E.I. du Pont de Nemours & Co., 81 OSAHRC 11/A9, 9 BNA OSHC 1296, 1981 CCH OSHD ¶25,194 (No. 79-2261, 1981). For example, the contesting employees and the Secretary might agree on the settlement of an abatement contest that is unacceptable to the intervening employer. The intervening party's interest does not disappear because the contesting party and the Secretary have reached a mutually agreeable resolution of the contest, particularly when the interest of the intervening party involves a statutory right of participation or a statutory obligation to comply.

It is obvious that problems could result in government enforcement actions if an intervening party could block the approval of the settlement merely by objecting to its terms. See NLRB v. Oil, Chemical & Atomic Workers Int'l Union, 476 F.2d 1031, 1034-5 (1st Cir. 1976); United States v. Ketchikan Pulp Co., 430 F.Supp. at 85. The anomaly of approving a settlement when one of the parties to the action objects to the agreement is also obvious. See Id.; Brennan v. Connecticut State UAW Community Action Program Council, 60 F.R.D. 626, 632 (D. Conn. 1973). A reasonable procedural balance is struck under these circumstances by affording the intervening party with an opportunity to be heard on its objections to the settlement, but permitting a settlement to be approved over those objections when the minimum conditions established by Commission Rule 100 and related case-law have been satisfied, e.g., Dawson Bros. - Mech. Contractors, 1 OSAHRC 386, 1 BNA OSHC 1024, 1971-73 CCH OSHD

¶15,039 (No. 12, 1972). Accordingly, the Commission must determine whether the settlement is consistent with the purposes and provisions of the Act before the intervening party's interests are extinguished by the entry of a final order approving the settlement. This procedure assures basic fairness to all interested parties and generally avoids the troublesome substitution of a private party for the government, be it the employer for the Secretary in an employee abatement contest or the employees for the Secretary in an employer contest. 30/

B

Again the Secretary claims that the consideration of the Union's objections by the Commission interferes with his "prosecutorial discretion" to settle enforcement actions. However, the Secretary misconstrues the Commission's procedural framework for consideration of settlements.

First, the employees' unilateral objections do not result in disapproval as a matter of right. Instead, the Commission considers the settlement

---

30/ It is presumed at this time that the Secretary would proceed appropriately if the Commission determines that the settlement agreement fails to satisfy the minimum requirements of Commission Rule 100. See Dunlop v. Bachowski, 421 U.S. 560, 574-6 (1975).

The issue of the Secretary's withdrawal of a citation under Fed. R. Civ. P. 41(a) is not before the Commission in this case; this case involves only the approval of a settlement over the objections of an intervening party. Accordingly, it is unnecessary to address either the court's holding in the Marshall v. OSHRC (IMC Chemical Group, Inc.), 635 F.2d 544 (6th Cir. 1980), that the Secretary may unilaterally withdraw a citation prior to the filing of a complaint and answer, or the underlying Commission decision holding that the Secretary's withdrawal does not terminate proceedings in which the employees have elected party status and objected to the withdrawal, 78 OSAHRC 95/C14, 6 BNA OSHC 2075, 1978 CCH OSHD ¶23,149 (No. 76-4761, 1978).

agreement and the objections in terms of Rule 100(a) to determine whether the settlement is "consistent with the provisions and objectives of the Act." 29 C.F.R. § 2200.100(a). Thus, the Secretary's discretion to settle is not unilaterally limited by employee participation and settlements have been approved over employee objections on numerous occasions. E.g., E.I. du Pont de Nemours & Co., supra.

Second, no party, including the Secretary, is the exclusive representative of the "public interest." This statute like the National Labor Relations Act establishes a statutory pattern that does not permit an easy dichotomy between "public" as contrasted with "private" interests. See International Union, UAW, Local 283 v. Scofield, 382 U.S. at 220. Instead, these two interests "interblend in the intricate statutory scheme." See Id.; 29 U.S.C. §§ 651(b)(1), (13). Though the Secretary is charged with enforcing a public right, Atlas Roofing Co., Inc. v. OSHRC, 430 U.S. 442 (1977), "to employ the rhetoric of 'public interest'...is not to imply that the public right excludes the recognition of parochial private interests," International Union, UAW, Local 283 v. Scofield, 382 U.S. at 218. The public interest is determined by the adjudication of the various adverse interests in Commission proceedings, not the unilateral representation of one party. See Id. at 221. Nor can it be assumed that there is an identity of interests between the exposed employees and the Secretary. See Trbovich v. United Mine Workers of America, 404 U.S. 528, 538-9 (1972); American Airlines Inc., 75 OSAHRC 43/F3, 2 BNA OSHC 1391, 1392, 1974-75 CCH OSHD ¶19,108 at p. 22, 838 (No. 6087, 1974). In fact, the party status conferred by the Act is an apparent recognition that the government might not always adequately protect the public interest.

See United States v. Ketchikan Pulp Co., 430 F.Supp. at 86. See generally Dunlop v. Bachowski, 421 U.S. 560, 571 n.9 (1975). 31/

---

31/ In analyzing the Secretary's enforcement discretion, the role of the General Counsel at the National Labor Relations Board is particularly pertinent. In unfair labor practice cases the "unique legal status" of the charging party in relation to the General Counsel is practically identical to the relations between an authorized employee representative and the Secretary. With respect to unfair labor practice complaints, section 10(b) of the National Labor Relations Act provides that "if it is charged that any person has engaged in or is engaging in any such unfair labor practice, the Board . . . shall have the power to issue and cause to be served upon such a person a complaint." 29 U.S.C. § 160(b). As successor to that power in 1947, the General Counsel "shall have final authority, on behalf of the Board, in respect of the investigation of charges and issuance of complaints under section 160 of this title and in respect of the prosecution of such complaints before the Board . . . . " 29 U.S.C. § 153(d).

The General Counsel's discretion is divided into two distinct time frames — pre-complaint and post-complaint. Compare United Elec. Contractors Ass'n v. Ordman, 366 F.2d 776 (2nd Cir. 1966), aff'g 258 F.Supp. 758 (S.D.N.Y. 1965) (dismissal of action seeking a mandatory injunction to compel the General Counsel to issue an unfair labor practice complaint) with NLRB v. Martin A. Gleason, Inc., 534 F.2d 466 (2d Cir. 1976)(NLRB and judicial consideration of a charging party's objections to a post-complaint settlement). Thus, the discretion to file an unfair labor practice complaint and determine the precise charges to be litigated is distinct from the right of the charging party to be heard on its objections to a settlement agreement between the General Counsel and the charged party after a complaint has been filed. Compare Saez v. Goslee, 463 F.2d 214 (1st Cir. 1972) with NLRB v. Oil, Chemical & Atomic Workers Int'l Union, 476 F.2d 1031 (1st Cir. 1973).

In the exercise of the General Counsel's post-complaint settlement discretion, the Fifth Circuit has held that a charging party "must be afforded (1) an evidentiary hearing on any material issues of disputed fact presented by [the] objections and (2) a presentation on the record of [the] reasons for acceptance of the settlement agreement notwithstanding the objections." Concrete Materials of Georgia,

(Continued on next page)

Third, the Commission does not sit to reassess the relative merits of the bargain between the parties, but only to determine that certain minimum conditions have been satisfied. The Commission's limited proceedings

---

31/ (Continued)

Inc. v. NLRB, 440 F.2d 61,68 (5th Cir. 1971)(citations omitted). The First and Ninth Circuits have expressly followed Concrete Materials, holding that the charging party is entitled to a hearing if it alleges facts which are disputed and materials to the Board's decision. NLRB v. Oil, Chemical & Atomic Workers Int'l Union, supra; NLRB v. International Bhd. of Elec. Workers, Local 357, 445 F.2d 1015 (9th Cir. 1971). The DC Circuit requires either a statement of reasons for accepting the settlement or an opportunity to be heard on the charging party's objections. International Ladies Garment Workers Union v. NLRB, 501 F.2d 823 (D.C. Cir. 1974); Textile Workers Union of America v. NLRB, 294 F.2d 738 (D.C. Cir. 1961). In contrast, the Third Circuit has held that a charging party is always entitled to a hearing on its objections. Marine Engineers Beneficial Ass'n No. 13 v. NLRB, 202 F.2d 546 (3d Cir.), cert. denied, 346 U.S. 819 (1953); Leed & Northrup Co. v. NLRB, 357 F.2d 527 (3d Cir. 1966). Compare George Ryan Co. v. NLRB, 609 F.2d 1249 (7th Cir. 1979) with International Union, UAW v. NLRB, 231 F.2d 237, 242 (7th Cir. 1979) and Oshkosh Truck Corp. v. NLRB, 530 F.2d 744 (7th Cir. 1976). The Second Circuit has considered the substantive objections raised by a charging party to a post-complaint settlement between the General Counsel and the charged party, NLRB v. Martin A. Gleason, Inc., 534 F.2d at 481-2, though this circuit has held that the charging party's consent is not necessary to effectuate a settlement and a charging party is not entitled to an independent evidentiary hearing on its objections to a settlement, Local 282, Int'l Bhd. of Teamsters v. NLRB, 339 F.2d 795 (2d Cir. 1964).

It is also noteworthy that the discretion delegated to the NLRB General Counsel varies considerably. In contrast to the discretion delegated under 29 U.S.C. §§ 153(d) and 160(b) with respect to unfair labor practices, in representation elections "[t]he Board . . . shall direct an election by secret ballot and shall certify the results thereof." 29 U.S.C. § 159(c). Moreover, the General Counsel "shall, on behalf of the Board petition . . . for appropriate relief" with respect to secondary boycotts. 29 U.S.C. § 160(l). This obligatory language is similar to the discretion delegated under both the Occupational Safety and Health Act and the Labor-Management Reporting and Disclosure Act -- "the Secretary shall issue a citation", 29 U.S.C. § 658(a), and "the Secretary shall bring a civil action," 29 U.S.C. § 482(a); Dunlop v. Bachowski, 421 U.S. 560 (1975).

(Continued on next page)

on the settlement agreement preserve the Secretary's independent party status while assuring that the interests of all parties are given due consideration. Furthermore, the Secretary's range of discretion in the negotiation of a settlement remains unaffected and subject only to a limited review of the agreement for the purposes of assuring procedural fairness to all parties, Anaconda Co., Wire & Cable Div., 80 OSAHRC 106/E2 9 BNA OSHC 1159, 1980 CCH OSHD ¶ 24,917 (No. 79-5449, 1980), the abatement of the hazard, Nashua Corp., 80 OSHRC 121/A2, 9 BNA OSHC 1113, 1980 CCH OSHD ¶25,020 (No. 78-2146, 1980), and the necessary vacation, modification, or affirmance of the citation, Commission Rule 100(b)(1), 29 C.F.R. § 2200.100(b)(1). The Commission's minimum conditions are regularly satisfied without any objection. E.g., Consolidated Edison Co. of New York, 81 OSAHRC 9/B2, 9 BNA OSHC 1267, 1981 CCH OSHD ¶25,165 (Nos. 80-999 & 80-1252, 1981) (Commission approval); Fike Chemicals, Inc.,

---

31/ (Continued)

The Commission, like the NLRB and other adjudicatory agencies, is necessarily granted discretion to promulgate rules regarding settlement and to determine whether the public interest is best effectuated by the acceptance or rejection of a settlement agreement. See Wallace Corp. v. NLRB, 323 U.S. 248 (1944) cited approvingly in Vermont Yankee Nuclear Power Corp. v. Natural Resources Defense Council, Inc., 435 U.S. 519, 544 n.18 (1978); NLRB v. Martin A. Gleason, Inc., 534 F.2d 466, 482 (2d Cir. 1976); NLRB v. Northern Cal. Dist. Council of Hod Carriers, 389 F.2d 721, 724-5 (9th Cir. 1968). As the court observed in Leeds & Northrup Co. v. NLRB regarding the settlement of an unfair labor practice charge, "these are sensitive areas in the labor-management complex which the adjudicatory process provided by the Act was designed to reach." 357 F.2d at 436 (Emphasis added). This is particularly true when Congress directs specific action to be taken in response to violative conditions. See Adams v. Richardson, 480 F.2d 1180 (D.C. Cir. 1973).

OSHRC No. 78-2473 (Aug. 1, 1979)(Administrative law judge approval). It is a rare case that generates an objection to the settlement, see E.I. du Pont de Nemours & Co., supra, and the exceptional case which results in the disapproval of the settlement, see Nashua Corp., supra. 32/

Finally, the Commission treats the settlement as an integrated, non-severable agreement reflecting the bargained-for-exchange of the parties who signed it. See United States v. Armour & Co., 402 U.S. 673, 682 (1971). As a consequence, the Commission does not selectively approve some provisions and disapprove others. See Connecticut Aerosols, Inc., 80 OSAHRC 16/A2, 8 BNA OSHC 1052,1980 CCH OSHD ¶ 24,256, (No. 78-25, 1980); Logan County Farm Enterprises, Inc., 79 OSAHRC 18/G9, 7 BNA OSHC 1275, 1979 CCH OSHD ¶ 23,425 (No. 78-4535, 1979); cf. Seaboard Coast Line Railroad Co., 76 OSAHRC 125/G4, 3 BNA OSHC 1760, 1975-76 CCH OSHD

---

32/ The lifeblood of the Act and the employees it seeks to protect must not be drained for the sake of administrative convenience. The dissent would create a one-way street to settlement for the mere purpose of administrative expedience, notwithstanding the direct statutory interest of affected employees in Commission proceedings. In the period from October 1976 through May 1982, the Commission disposed of 25,445 cases on the basis of settlements and withdrawals — more than 75 percent of the total caseload. In that same period a mere 16 cases involving employee objections to settlements and withdrawals, including this one, have been directed for review. In addition, there were a small number of cases involving employee objections that were not directed for review in this period. Certainly, some employees may have been discouraged from objecting based on the narrow grounds permitted under United States Steel, 77 OSAHRC 12/C3, 4 BNA OSHC 2001, 1976-77 CCH OSHD ¶21,463 (No. 2975, 1977). However, employees were not completely barred from raising their objections before the Commission and thus it cannot be concluded that the Commission's past experience with employee objections is "inapposite or unrepresentative" as argued in the dissent. Furthermore, the dissent claims that cases may not be settled by the Secretary as a consequence of this ruling. However, if the Secretary concludes in the exercise of his enforcement discretion not to settle a case on the basis of employee objections, that certainly must be the Secretary's prerogative as is the discretion to settle.

¶20,184 (No. 10541, 1975), appeal dismissed, No. 76-1058 (D.C. Cir. March 15, 1976)(Commission concluded it would be unfair to a Respondent for the Commission to abrogate one term of a stipulation while leaving the remainder intact). Similarly, no modifications are made in the settlement by the Commission; it is reviewed as submitted by the parties and their motion to approve is either granted or denied. In this context the Commission does not modify the abatement provisions to satisfy any concerns it may have regarding the sufficiency of that abatement. In addition to assuring procedural fairness and protecting the public interest, these minimum conditions preserve the statutory interests of all parties without any sacrifice in the Secretary's discretion except to submit the contested citation to final adjudicatory resolution as prescribed by the statute. Once the employees have elected party status, the Commission is obligated to consider the objections to the settlement. If the review were circumscribed by a extremely narrow standard of review, the right of intervention would be a hollow right indeed. United States v. Ketchikan Pulp Co., 430 F.Supp. at 86.

C

The Union's objection in this case concerns one of the central purposes of the Act -- the abatement of allegedly hazardous conditions. See Farmer's Export Co., 80 OSAHRC 66/A2, 8 BNA OSHC 1655, 1980 OSHD ¶24,569 (No. 78-1708, 1980). In fact, disputes concerning the steps an employer must take to abate a violation are familiar controversies before the Commission.[33/] Even in UAW Local 588 the Commission read

---

33/ The following illustrate the range of abatement issues resolved by

(Continued on next page)

section 9(a) of the Act, 29 U.S.C. § 658(a), which requires the citation "to fix a reasonable time for the abatement of the violation", as authorizing the use of abatement plans. 4 BNA OSHC 1243, 1244, 1976-77 CCH OSHD ¶20,737 at p. 24,865. Under whatever circumstances abatement is an issue in a Commission proceeding, employees who are affected by a hazardous condition are in a unique position to offer information on the basis of their knowledge and experience as to whether a particular procedure will abate the cited hazard. It is the employees who obviously have the most direct interest in assuring that abatement is accomplished. Where, as here, affected employees object to an abatement plan in a settlement agreement on the grounds that it will not achieve abatement of a cited

---

33/ (Continued)

the Commission:

(1) The Secretary's allegation that an employer has failed to correct a violation established by a prior final order of the Commission may be contested, invoking the Commission's jurisdiction to determine whether any of the steps the employer took to abate the violation satisfied its obligation under the previous order. 29 U.S.C. § 659(b).

(2) When a dispute concerning the reasonableness of the abatement period specified in a citation is before the Commission a reasonable abatement time must be determined and it may be necessary for the Commission to inquire into and resolve disputes concerning the appropriate method of abatement to achieve compliance in the shortest time. See UAW Local 588, supra; cf. Amoco Chemicals Corp., 80 OSAHRC 15/E3, 8 BNA OSHC 1085, 1980 CCH OSHD ¶24,253 (No. 79-4874-P, 1980); Gilbert Mfg. Co., 79 OSAHRC 68/A2, 7 BNA OSHC 1611, 1979 CCH OSHD ¶23,782 (No. 76-4719, 1979).

(3) Where the Secretary and a cited employer agree to settle a case that is within the Commission's jurisdiction, a statement of the employer's abatement obligations must be included in the agreement, which may be approved only if the agreement is consistent with the provisions and objectives of the Act. Farmers Export Co., supra; Commission Rule 100(a), 29 C.F.R. § 2200.100(a).

(Continued on next page)

hazard and they elect party status in a Commission proceeding in which that plan is submitted for approval, it would be contrary both to the purposes of the Act and to the Commission's independent adjudicatory responsibility under the Act to refuse to hear the employees' objection in determining whether the plan actually abates the hazardous condition and ultimately whether the entire agreement satisfies the minimum conditions required for approval.

Even the majority in UAW Local 588 stated that in the context of an employee notice of contest as to the abatement period, "the union may properly adduce evidence to show that the employer's abatement plan does not include all feasible abatement methods or controls that are presently available." 4 BNA OSHC at 1244, 1976-77 CCH OSHD ¶20,737 at p. 20,866. Thus, the majority implicitly recognized that the abatement method and the reasonable period of time for its accomplishment are inextricably intertwined. For this additional reason it is inappropriate to read the

---

33/ (Continued)

(4) In order to prove a violation of the "general duty clause," 29 U.S.C. §654(a)(1), the Secretary must prove the feasibility and likely utility of his proposed means of abating the violation. E.g. National Realty & Constr. Co. v. OSHRC, 489 F.2d 1257 (D.C. Cir. 1973).

(5) Certain OSHA standards specifically require proof of the feasibility of means of abating the hazardous condition. E.g. 29 C.F.R. § 1910.95(b)(1)(the occupational noise standard).

(6) Under certain standards the Commission requires the Secretary to identify means of abatement as part of his prima facie case. E.g., 29 C.F.R. § 1926.28(a)(the construction safety personal protective equipment standard).

statute in a manner allowing employees to prove that an abatement method is ineffectual, yet not authorizing the Commission to enter an appropriate order approving or disapproving the settlement agreement.

Finally, even if we were to accept the Secretary's view that participating employees are limited in their participation to the allegation that "the period of time fixed in the citation for the abatement of the violation is unreasonable," the Secretary's narrow construction of this statutory phrase as "abatement date" is misplaced and inconsistent with the remedial purposes of the Act.

Section 10(c) simply reflects the statutory language of section 9 of the Act, which states,

> In addition, the citation shall fix a reasonable time for the abatement of the violation.

29 U.S.C. § 658(a). Thus, that section of the statute authorizing the Secretary to issue citations makes no reference to abatement requirements or abatement plans, but refers only to the <u>time</u> for abatement of a violation. Similarly, section 10(c), in affording employees the right to file notices of contest with respect to abatement, uses parallel language concerning the period of time for abatement. Inasmuch as the manner for achieving abatement is not ordinarily set forth in the citation, it would be impossible for employees to file a notice of contest regarding the abatement method. As a result, it would be absurd for the Act to provide for employee notices of contest as to any aspect of abatement other than time, the only abatement factor required to be identified by section 9(c) of the Act.

Time and abatement are inextricably intertwined. The period of time fixed in the citation has meaning only in relation to the abatement of the violative

condition or hazard. As the Commission observed in UAW Local 588 "specific methods or controls and the time required for their implementation are determinative of the length of time needed for abatement." 4 BNA OSHC at 1244, 1976-77 CCH OSHD ¶ 20,737 at p. 24,866. A simple date devoid of abatement is meaningless in terms of assuring "so far as possible every working man and woman in the Nation safe and healthful working conditions". 29 U.S.C. § 651(b). Employees may be left at risk because: (1) there is no actual abatement as a result of the settlement; (2) interim abatement steps may not assure protection while a comprehensive engineering solution is installed, Nashua Corp., supra; (3) abatement is incomplete because it cannot remove all exposed employees from risk; or, (4) ineffective methods of abatement have been selected rather than effective abatement methods. In each of these examples abatement will not have been achieved and employees will continue to be at risk from exposure to hazardous physical conditions or toxic substances. Accordingly, Commissioner Cleary and I overrule the Commission's decision in UAW Local 588 to the extent it held that the statutory language of section 10(c) limits employee participation to the date set for abatement. 34/

This is not to suggest that the employees' objections bar approval of the settlement but only that their objections must be considered in determining whether approval of the settlement agreement is appropriate. An evidentiary hearing is not required when a sufficient foundation for the serious consideration of the employees' objections may be established by other equally effective means. See NLRB v. Oil, Chemical & Atomic

---

34/ In Marshall v. Oil, Chemical & Atomic Workers Int'l Union, 647 F.2d 383, 388 (3d Cir. 1981), the court suggests that in the absence of

(Continued on next page)

Workers Int'l Union, 476 F.2d at 1035-6 and cases cited; United States v. Ketchikan Pulp Co., 430 F.Supp. at 86.

V

As Justice Frankfurter observed, "We are not concerned with law enforcement practices except insofar as the courts themselves become instruments of law enforcement." McNabb v. United States, 318 U.S. 322, 347 (1943). The history of statutes as well as "[t]he history of liberty has largely been the observance of procedural safeguards." Id. In safeguarding the employees' express statutory rights under the Act, the approval of a settlement is a "judicial act which deserves more than the court's rubber stamp on the agency's action." United

---

34/ (Continued)

any abatement date the employee's right of participation is even further limited. However, section 9(a) of the Act provides that "a citation shall fix a reasonable time for the abatement of the violation." 29 U.S.C. § 658(a)(emphasis added). The Secretary may not preclude the employee's statutory right to be heard by omitting a time period from the citation. Similarly, the Secretary may not accomplish the same result by accepting the unilateral representation of the employer in the settlement agreement that abatement has already been achieved when employees claim that no abatement has occurred. Relegating the employees to a new enforcement complaint is inefficient, time-consuming, hazardous and inconsistent with the Commission's independent adjudicatory authority. See Part IIIB, supra .

States v. Ketchikan Pulp Co., 430 F.Supp. at 86. Thus, the judicial power is exercised when judgment is entered on the basis of consent, Pope v. United States, 323 U.S. 1, 12 (1944), and the approval of a consent decree becomes an adjudication of the court, United States v. Ling-Temco-Vought, Inc., 315 F.Supp. 1301 (W.D.Pa. 1970). Because the judge declined to consider the Union's objections in approving the settlement agreement, this case is remanded for further adjudicatory proceedings consistent with the requirements of the statute and Commission rules.

SO ORDERED.

FOR THE COMMISSION

Ray H. Darling, Jr.

RAY H. DARLING, JR.
EXECUTIVE SECRETARY

DATED: AUG 6 1982

CLEARY, Commissioner, concurring:

I agree with Commissioner Cottine that employees who have elected party status under section 10(c) of the Act have a right to be heard on their substantive objections to an abatement plan, and that United States Steel Corp., 77 OSAHRC 12/C3, 4 BNA OSHC 2001, 1976-77 CCH OSHD ¶ 21,463 (No. 2975, 1977), must be overruled to the extent it holds that employee party status is statutorily limited to challenging the reasonableness of the abatement period.[35/] I also agree that a settlement agreement cannot be judged for consistency with the purposes and objectives of the Act without a hearing on employees' substantive objections.[36/] When affected employees or their authorized representative object to a proposed abatement plan, those objections must be taken into consideration

---

35/ Indeed, it was in my dissenting opinion in United States Steel that I first stated that "[t]here is nothing in the Act or in the Commission rules that limits the participation of an employee representative once party status has been elected. Neither the Act nor our rules envision that an employee representative be a party for limited purposes. I submit that an employee representative is a full party with all rights of any party, including the right to join or object to settlement." 4 BNA OSHC at 2003, 1976-77 CCH OSHD at 25,742. See also my dissenting opinion in Southern Bell Telephone & Telegraph Co., 77 OSAHRC 83/D1, 5 BNA OSHC 1405, 1977-78 CCH OSHD ¶ 21,840 (No. 10340, 1977), in which I first stated my view that employees have a right to be heard in opposition to the Secretary's motion to dismiss the citation and complaint.

36/ I also agree with Commissioner Cottine that abatement method and abatement period are inextricably intertwined and this alone would be sufficient basis for employees' right to be heard on substantive objections to an abatement plan. However, this would be an alternative basis for the disposition of this case, and for the reasons given above, I regard the last sentence of § 10(c) as the primary source of employees' rights in the adjudicatory process, including the right to a hearing on objections to settlement.

by the administrative law judge in determining whether the agreement meets the minimum conditions established by Commission Rule 100. In the words of the Secretary of Labor, "election of party status by an authorized employee representative entitles said representative to meaningful participation in the settlement process." ITT Thompson Industries, Inc., 78 OSAHRC 70/D10, 6 BNA 1944, 1978 CCH OSHD ¶ 22,944 (No. 77-4174, 1978). The "right to meaningful participation" is meaningless if it does not include the right to be heard on substantive objections to a settlement agreement.

I

The immediate question before us is whether an administrative law judge must consider employee objections to an abatement plan in determining whether a settlement agreement comports with the provisions and objectives of the Act. To answer that question, we must answer the larger one: what rights do employees have under section 10(c) of the Act? Section 10(c) provides in pertinent part:

> If an employer notifies the Secretary that he intends to contest a citation issued under section 9(a), or notification issued under subsection (a) or (b) of this section, or if, within fifteen working days of the issuance of a citation under section 9(a), any employee or representative of employees files a notice with the Secretary alleging that the period of time fixed in the citation for the abatement of the violation is unreasonable, the Secretary shall immediately advise the Commission . . . and the Commission shall afford an opportunity for a hearing (in accordance with section 554 of title 5, United States Code, but without regard to subsection (a)(3) of such section) . . . . The rules of procedure prescribed by the Commission shall provide affected employees or representatives of affected employees an opportunity to participate as parties to hearings under this subsection.

Four United States Circuit Courts of Appeals have considered the matter and have concluded that employees' rights under section 10(c) are limited to challenging the reasonableness of the abatement period. The courts' reading of employee rights under section 10(c) is based on their interpretation of the overall scheme of the Act, its legislative history, and general principles of exclusive prosecutorial discretion.

However, a restrictive reading of section 10(c) with respect to employee enforcement rights is not supported, much less dictated, by the reasons given by the circuit courts, nor is it consistent with the purpose of the Act, which is to promote employee safety and health.

II

In holding that section 10(c) does not give employees the right to challenge the adequacy of an abatement plan agreed upon by the Secretary and the employer, the Third Circuit stated that the Act's legislative history shows that Congress did not intend for employees to be heard on matters other than the reasonableness of the abatement period. Sun Petroleum Products Co., 622 F.2d 1176 (3d Cir.), cert. denied, 101 S.Ct. 784 (1980). The court found evidence of legislative intent in a statement in the Senate Committee Report that section 10(c) "gives an employee or representative of employees a right, whenever he believes that the period of time provided in a citation for abatement of a violation is unreasonably long, to challenge the citation on that ground." LEGIS. HIST. at 155 (emphasis added by Third Circuit), and a statement by Senator Williams that "[e]mployees are also given appeal rights when they believe that an unreasonably long period of time

has been allowed for abatement of a violation," LEGIS. HIST. at 414 (emphasis added by Third Circuit).

The court also concluded that the overall administrative "schema" vests unreviewable and exclusive prosecutorial powers in the Secretary: "Necessarily included within these prosecutorial powers is the discretion to settle citations issued against employers and to compromise, mitigate or settle any penalty assessed under the Act. 29 U.S.C. § 655(e)." Marshall v. Sun Petroleum Products Co., 622 F.2d at 1187. The court regarded matters of settlement and compromise as "basic administrative responsibilities" which Congress intended to place with the Secretary and beyond Commission review. Again quoting Senator Williams, the court suggested that Commission review of employee objections to the substance of settlement agreements would lead to "diffusion of responsibility and accountability as to seriously undermine the effectiveness of this program." LEGIS. HIST. at 417. In Marshall v. OCAW and OSHRC, 647 F.2d 383 (3d Cir. 1981), the Third Circuit further ruled, for the same reasons stated in Sun Petroleum, that employees have no right under section 10(c) to contest the representation of a settlement agreement that abatement has occurred.

The Sixth Circuit concluded that employees may not prosecute a citation before the Commission after the Secretary has moved to withdraw it because "the Act, by its terms, makes the Secretary the exclusive prosecutor of OSHA violations." Marshall v. OSHRC (IMC Chemical Group, Inc.), 635 F.2d 544, 550 (6th Cir. 1980).[37/]

---

37/ The IMC court also stated that that provision in section 10(c) which authorizes employees to contest the reasonableness of the abatement period "is the only provision

The Seventh Circuit ruled that employees have no right to challenge the adequacy of an abatement plan because section 10(c) limits the Commission's adjudicative powers to consideration of whether the period of time fixed in the citation for the abatement of the violation is unreasonable. Automobile Workers v. OSHRC, 557 F.2d 607 (7th Cir. 1977). Like the Third Circuit, the Seventh quoted from that portion of the Senate Report which states that section 10(c) gives an employee or union the right to challenge the Secretary's citation on the ground that the abatement date provided therein is unreasonably long. In addition, the Seventh Circuit states that "a plain reading" of Section 10(c) shows that Commission review is limited to the reasonableness of the abatement period.

The D.C. Circuit, in deciding the scope of employee rights to appeal from a final order of the Commission, endorsed the holdings of the Third, Sixth and Seventh Circuits and stated that "so broad a reading of prosecutorial discretion under the statute . . . comports with the Congressional intent that the Secretary be charged with the basic responsibilities for administering the Act." Oil, Chemical and Atomic Workers v. OSHRC, 671 F.2d 643, 650 (D.C. Cir. 1981), pet. for cert. filed sub nom. American Cyanamid v. OCAW, (March 26, 1982) (No. 81-1784).

---

37/ (Continued)

in the Act authorizing an affected employee to participate in OSHA proceedings before the Commission." 635 F.2d at 551. This, of course, is incorrect. Section 10(c) also provides, in its concluding sentence, that affected employees may elect party status. Both the D.C. Circuit, in OCAW v. OSHRC, supra, and the dissenting judge in the Third Circuit's Sun Petroleum case noted this.

The courts are saying, in each case, that employees must be excluded from substantive participation in Review Commission proceedings in order to assure the Secretary exclusive prosecutorial discretion, and that the Secretary's exclusive prosecutorial role requires that employees be excluded from substantive participation in enforcement proceedings. But why? Does the legislative "scheme" or the legislative history really show that the Secretary must have exclusive and unreviewable control over enforcement proceedings once a citation is issued and that employee participation is limited to questioning the reasonableness of the abatement period? If not, do general principles of "exclusive prosecutorial discretion" require that result? And if neither prosecutorial "discretion" nor the legislative scheme and history demand preclusion of employees from substantive participation before the Commission, what construction of the statutory language best serves the purpose of the Act, which is to promote employee safety and health?

III

Our analysis must begin with the language of the Act, specifically, the last sentence of section 10(c), which provides that "[t]he rules of procedure prescribed by the Commission shall provide affected employees or representatives of affected employees an opportunity to participate as <u>parties</u> to hearings under this subsection." (emphasis added) The key word is "parties"; what does it mean that employees have the right to participate as parties?

The terms "party" and "parties" have many different meanings and definitions, depending generally upon the context in which they are used, but in connection with judicial proceedings the term "parties" is a technical word with a precise, legal meaning. A party to a judicial proceeding is, generally, one of the opposing litigants, whether a natural or legal person. A person is not a true party to an action even though he is named in a pleading unless he is competent to sue and has a right to control the proceedings, defend, adduce and cross-examine witnesses, and appeal in his own right. It is the right to control the proceedings that is the hallmark of a party to a judicial proceeding. One who has such rights is generally called a "principal party" to distinguish him from other parties to the action such as parties in interest, warrantors, parties opposing, and intervenors. An intervenor party, for example, although generally permitted to submit evidence, cross-examine witnesses, and appeal from a final order, may participate only by leave of court, after objections from the principal parties to his appearance have been heard, and under whatever restrictions the court deems appropriate.[38/] 67A C.J.S. Parties §§ 3, 68, 69; 59 AM.JUR.2d Parties § 7.

If "party" is a legal term of art describing one with the rights of a plaintiff or defendant, i.e., having the right to control the judicial proceeding, and there are those who say that under the Occupational Safety and Health Act employees'

---

38/ Even when an intervenor enters litigation pursuant to Fed.R.Civ.P. 24(a)(1), which provides that "anyone shall be permitted to intervene in an action: (1) when a statute of the United States confers an unconditional right to

only substantive right with respect to enforcement of a citation is to challenge the reasonableness of an abatement period, we must ask whether other provisions in the Act, its legislative history, or its purpose, show that "party" within section 10(c) means something less than "principal party."

The language in the Act which has caused courts strictly to limit the scope of employee participation in Commission proceedings is that clause in section 10(c) which provides: "if, within fifteen working days of the issuance of a citation . . . any employee or representative of employees files a notice with the Secretary alleging that the period of time fixed in the citation for the abatement of the violation is unreasonable, . . . the Commission shall afford an opportunity for a hearing . . . ." As the Seventh Circuit put it, "[u]nder a plain reading of section 10(c), the Commission may review only the reasonableness of the period of time fixed in the citation for the abatement of the violation." Automobile Workers v. OSHRC, supra, 557 F.2d at 609. In the courts' view, this provision states the outer bounds of any legitimate dispute between the Secretary and employees.

However, explicit inclusion of this right should not be construed as an implicit preclusion of other rights, especially in light of the peculiar relationship that can sometimes develop

---

38/ (Continued)

intervene" (emphasis added), the scope of the intervenor's participation may be limited in subordination to the interests of the principal parties. See Shapiro, Some Thoughts on Intervention Before Courts, Agencies, and Arbitrators, 81 HARV.L.REV.721 (1968).

between the Secretary and employees wherein the employees agree with the Secretary that a violation exists, but disagree with the Secretary with respect to abatement. When this occurs, employees have no interest in contesting the citation, but they do have an interest in contesting one, subsidiary, provision in the citation. The second clause of section 10(c) merely acknowledges this reality and makes plain that employees have the right to contest something less than the entire citation. Examined from another angle, this provision also serves the purpose of vesting jurisdiction in the Commission, at the behest of employees, over less than the entire citation. This scheme is entirely consistent with section 10(a), which explicitly provides for an employer right to limit a contest to the amount of penalty only.

The Seventh and Third Circuits relied heavily on pronouncements in the Senate Committee Report and by Senator Williams that employees have the right to contest the period of abatement as evidence that this is their only right. However, the quoted passages are virtually identical to the very language in question, they appear in the legislative history unaccompanied by any discussion or elaboration whatever, and there is not a shred of evidence elsewhere in the legislative history to indicate that Congress wished to withdraw from employees those rights that normally flow from party status. Under these circumstances the quoted statements are incapable of shedding light on the statutory language, and just as the clause itself cannot reasonably be taken as preclusive, neither can these excerpts.

IV

The second important reason for the courts' unwillingness to treat employees as principal parties is that, in their view, to do so would be to infringe on the Secretary's prosecutorial powers. They infer that Congress intended that the Secretary's exercise of prosecutorial powers be exclusive and beyond Commission review from the fact that Congress separated the three agency functions--regulatory, enforcement and adjudicative--placing the first two with the Secretary and the last with the Commission. In the words of the D.C. Circuit, "so broad a reading of prosecutorial discretion under the statute . . . comports with the Congressional intent that the Secretary be charged with the basic responsibilities for administering the Act." OCAW v. OSHRC, supra.

However, it is clear from the legislative history that Congress' purpose in separating the adjudicative from the regulatory and enforcement functions was to avoid placing an undue concentration of power in the hands of one individual and had nothing to do with the scope of employee rights in adjudicative proceedings.

> The concentration of all authority for the promulgation of standards, the inspection and investigation of complaints, the prosecution of cases, and the adjudication of cases, totally in the hands of the Secretary of Labor is not a balanced approach . . . . It is objectionable because concentration of power gives rise to a great potential for abuse. A single man is easier to harass than an independent board or commission. Political pressure can be concentrated to achieve a particular point of view or course of action. The tradition of this Nation has been to place safeguards on power whenever it is granted. One of the greatest safeguards has been the separation of powers. By separating the legislative, executive, and judicial functions, a balance has been achieved which permits progress without abuse of authority.

LEGIS. HIST. at 420.

"While the concentration of authority may lead to more efficient action in line with a particular point of view, it also raises the [specter] of abuse." LEGIS. HIST. at 201.

There were those who thought that the Department of Labor had been captured by business.[39/] Others regarded the Department as the tool of Labor.[40/] But no one seriously disputed that it was crucial that the Occupational Safety and Health Act, whatever its contours, inspire confidence in the impartiality of its administration: "The important thing is to inspire confidence in the community that we expect to obey this law . . . . There is no question about the fact that the community will be considerably reassured in the difficult, and one might say dangerous situation, by the adoption of this amendment placing the adjudi-

---

39/ In considering whether adjudicative function ought to be with the Secretary or with an independent body, Senator Javits stated:

> I, for one, believe that in the light of over 30 years of utterly dismal performance by the Department of Labor of its safety and health responsibilities under the Walsh-Healey Act, labor has little reason to expect, or business any reason to fear, overly energetic administration of this act by the Secretary of Labor or disregard by him of the legitimate concerns of business.

LEGIS. HIST. at 194.

40/ Senator Holland from Florida:

> I know perfectly well, from my own experience as a lawyer over a good many years, that the impression prevailed that the labor unions and the labor union administrators and managers and leaders were much too close to the personnel of the Board under the Wagner Act, and that fair and objective and impartial judgments were not to be expected from that agency . . . . There was the feeling that the decisions of the then

cative function in an independent agency."41/

There is simply no basis in the legislative history for the courts' suggestion that Congress, by assigning the adjudicative function to an independent body, meant to preclude that body from considering the Secretary's exercise of prosecutorial discretion for consistency with the remedial purpose of the Act. Indeed, all the evidence indicates that Congress regarded employers and employees as parties of equal standing. In discussing a provision under which a plant could be shut down due to imminent dangers, Senator Tower observed that "Government, labor, and management [should] have an equal stake in improving safety conditions . . . .[W]e must insure that employers and employees alike have a stake in improving these conditions. Labor-management relations can only improve if a sense of harmony and cooperation between employer and employee alike exists, independent of an omnipotent centralized voice from Washington." LEGIS. HIST. at 448. Senator Williams stated that permitting employees to accompany OSHA inspectors on inspections

> reflects a fair and practical resolution of the conflicting viewpoint of employers who fear that an unlimited right of employees to accompany inspectors could lead to disruption of production operations and, the viewpoint of employees who

---

40/ (Continued)

> Secretary of Labor--and I again say that I do not question his soundness of conscience--were not practicable, were not objective, and were much more nearly in accord with the demands and expectations of those who were directly representing the labor organizations.

LEGIS. HIST. at 473; see also Senator Holland's remarks at 474-5.

41/ LEGIS. HIST. at 469, Senator Javits.

> urgently believe they need their representatives to participate and assist in the inspection which is so important to their continued protection on their job.
>
> I think this is an important point. Certainly no one knows better than the working man what the conditions are, where the failures are, where the hazards are, and particularly where there are safety hazards. The opportunity to have the working man himself and a representative of other working men accompanying inspectors is manifestly wise and fair . . . .

LEGIS. HIST. at 430.

Of particular significance is the fact that the Act itself limits the Secretary's prosecutorial discretion. If, upon receipt of an employee complaint of a serious violation or an imminent danger, the Secretary "determines there are reasonable grounds" he must make an inspection as soon as practicable. If he determines that there are no reasonable grounds to believe that a violation or danger exists, he must notify the employees in writing. Section 8(g). If, upon inspection, the Secretary believes that a violation exists, he must issue a citation. Section 9(a). Section 6(e) of the Act, which is generally ignored, provides that "Whenever the Secretary promulgates any standard, makes any rule, order, or decision, grants any exemption or extension of time, or compromises, mitigates, or settles any penalty assessed under this Act, he shall include a statement of the reasons for such action, which shall be published in the Federal Register." All these restrictions have been placed on the Secretary's prosecutorial discretion, despite Congress' fine awareness that his resources would be limited (and perhaps because of a fine awareness of the political pressures which

would be operating upon him).[42/]

It simply makes no sense to say that an adjudicative body, created for the express purpose of assuring that the Secretary performs his enforcement function with the maximum of fairness, is unduly involved in the "basic administration"[43/] of the Act if it hears objections to settlement agreements and withdrawal of citations.[44/]

Although the courts do not say so explicitly, it is apparent that they consider employee and Commission involvement in settlement agreements and withdrawal decisions as an undue interference with the Secretary's prosecutorial discretion. The tradition is well established that prosecutorial powers, by their nature, are exclusive and unreviewable. After all, the reasoning goes, the prosecutor knows his own resources, the quality of the evidence that has been collected, how a particular case fits into an overall enforcement strategy. He should not be forced to spend resources he does not have. He should not be forced to prosecute an unwinnable case. Nothing is gained by forcing him into litigation that undermines a larger strategy. The United

---

42/ The fact that Congress was conscious of the Secretary's vulnerability to special interest pressure has been discussed above. Congress was also aware that he would have limited resources. See LEGIS. HIST. 399 and 471.

43/ See OCAW v. OSHRC, 671 F.2d 643 (D.C. Cir. 1981), in which the court stated that employee challenges to the Secretary's decision to settle or drop a case would not comport with Congressional intent that the Secretary be charged with "basic responsibility for administering the Act."

44/ In the Commission's Sun Petroleum decision, 79 OSAHRC 26/C1, 7 BNA OSHC 1306, 1977-78 CCH OSHD ¶ 21,870 (No. 76-3749, 1979), Commissioner Barnako stated that the Commission has no authority to specify abatement measures. But the proper question is whether the Commission has authority to examine abatement plans for consistency with the Act's purpose.

States Court of Appeals for the District of Columbia, for example, in holding that it was powerless to intervene where it appeared that a United States Attorney had treated two individuals indicted for the same offense disparately, stated:

> Few subjects are less adapted to judicial review than the exercise by the Executive of his discretion in deciding when and whether to institute criminal proceedings, or what precise charge shall be made, or whether to dismiss a proceeding once brought. . . . Two persons may have committed what is precisely the same legal offense but the prosecutor is not compelled by law, duty or tradition to treat them the same as to charges. . . . [N]o court has any jurisdiction to inquire into or review his decision. . . . [W]hile this discretion is subject to abuse or misuse just as is judicial discretion, deviations from his duty as an agent of the Executive are to be dealt with by his superiors. . . . [I]t is not the function of the judiciary to review the exercise of executive discretion whether it be that of the President himself or those to whom he has delegated certain of his powers.

Newman v. United States, 382 F.2d 479, 480, 481-82 (D.C. Cir. 1967).

To paraphrase Plato, the unexamined rule is not worth having, and the question must be asked, why is it not the function of the judiciary to review the exercise of executive, or prosecutorial, discretion? Will review necessarily impede the Secretary's management function by involving him in unwinnable and unaffordable litigation?

Professor Davis, in his treatise on administrative law, poses some extremely cogent questions: "[i]nstead of saying that 'few subjects are less adapted to judicial review' than prosecutors' discretion, why not say that few subjects are more adapted to a judicial check to prevent abuse of discretion, including a judicial requirement that findings and reasons be adequately stated?" DAVIS, ADMINISTRATIVE LAW TEXT 522, § 28.07 (3d. ed. 1972) (hereafter "DAVIS"). Instead of saying that "it is not the function of the

judiciary to review the exercise of executive discretion," why not cite a hundred Supreme Court decisions holding that the judicial function is to review the exercise of executive discretion in order to check abuse, and why not observe that under the Administrative Procedure Act judicial review of discretionary action is the rule and unreviewability is the exception?45/ Instead of saying that no court has jurisdiction to review executive discretion, why not point out thousands of cases in which federal courts do review executive discretion?

Professor Davis points out that the tradition of unreviewability of prosecutorial discretion became settled in the nineteenth century when courts adhered to the now outmoded view that "interference of the Courts with the performance of the ordinary duties of the executive departments of the government would be productive of nothing but mischief." Decatur v. Paulding, 39 U.S. 497, 516 (1840). Yet, as the very existence of the Administrative Procedure Act testifies, limited judicial review can occur without judicial assumption of power committed to administrators.

---

45/ Section 554(c) of the APA, 5 U.S.C. § 554(c), provides in pertinent part:

> The agency shall give all interested parties opportunity for (1) the submission and consideration of facts, arguments, offers of settlement, or proposals of adjustment when time, the nature of the proceedings, and the public interest permit.

> We have learned during the present century that the exercise of administrative discretionary power is not weakened but can be strengthened by a limited judicial review. Our modern system of judicial review of administrative action is built upon almost precisely the opposite of the Court's 1840 pronouncement: We now know that a judicial check to prevent or correct abuse of discretion in the performance of the ordinary duties of the executive departments of the government makes for better administration and for a higher quality of justice. This is why the courts developed a presumption of reviewability, and this is why Congress carried that presumption into the Administrative Procedure Act.

DAVIS, supra at 523.

The unfettered power to settle or withdraw for good reason is also the unfettered power to settle or withdraw due to favoritism, caprice, or neglect and may be extremely damaging to private interests. And the interest at stake here is considerable--the safety and health of human beings. Although Justice Douglas may be describing more an ideal than a practical reality inasmuch as absolute discretion is not always pernicious or even undesirable, he states a guiding principle when he says: "Law has reached its finest moments when it has freed man from the unlimited discretion of some ruler, some civil or military official, some bureaucrat. Where discretion is absolute, man has always suffered . . . . Absolute discretion . . . is more destructive of freedom than any of man's other inventions." United States v. Wunderlich, 342 U.S. 98, 101 (1951). And: "Absolute discretion, like corruption, marks the beginning of the end of liberty." New York v. United States, 342 U.S. 882, 884 (1951).

V

The legislative history and the structure of te Act itself demonstrate, on the one hand, a complete lack of Congressional intent to bestow absolute prosecutorial discretion in the Secretary, and on the other, Congressional intent that employees play a central and active role in the OSHA process. As mentioned above, Senator Williams argued in favor of employee walk-around rights because "no one knows better than the working man what the conditions are, where the failures are, where the hazards are . . . ." LEGIS. HIST. at 430. Senator Tower stressed that employers and employees should have an equal stake in improving safety conditions. LEGIS. HIST. at 448. Congress was well aware of the conflict that often exists between employers and employees[46/] and that employees might attempt to abuse the OSHA process.[47/] Nevertheless, as Commissioner Cottine documents, the Act is

---

46/ LEGIS. HIST. at 474-5.

47/ Senator Saxbe: "If the employee wants to be a harrassing agent, of course he can send in a complaint every day, and then the Secretary would have to determine whether it is genuine." LEGIS. HIST. at 398.

Representative Scherle from Iowa:

> As it stands at the time of the issuance of this citation, the employer is simply accused of violating one of his duties under the Act. However, he must post, in conspicuous places on his bulletin boards and near the place of the violation, the accusation of the Federal Government. It can be expected that the unions will make use of these accusations in any bargaining sessions, and in addition, you must remember

replete with provisions which bring employees into the heart of the OSHA process.

One of the assumptions underlying the idea that employees need not be treated as principal parties despite the language of section 10(c) is that their interests are adequately represented by the Secretary, who has a legislative mandate to protect employee safety and health. But the Secretary represents public interests as well as the interests of employees at a particular site. As the United States Supreme Court observed when it acknowledged that the Secretary of Labor's obligations to the public interest may conflict with his obligations to individual union members in litigation under the Labor-Management Reporting and Disclosure Act of 1959, "[e]ven if the Secretary is performing his duties, broadly conceived, as well as can be expected, the union member may have a valid complaint about the performance of 'his lawyer.'" Trbovich v. United Mine Workers of America, 404 U.S. 528, 539 (1972). The court concluded that the mere possibility of inadequate representation by the Secretary entitles unions to a limited right to participate in Title IV litigation even though the Labor-Management Reporting and Disclosure

---

47/ (Continued)

> that the Taft-Hartley Act allows employees, under certain conditions, to leave a job where certain hazardous conditions exist. It is conceivable that after the employer has been accused of having an unsafe plant that the employees could walk off, and use the accusation of the Department of Labor as the reason for the wildcat strike.

LEGIS. HIST. at 1223-4.

Act makes no explicit provision whatever for union participation.[48]

The idea of "the public interest" should not be misunderstood. The public interest is no single thing, there are many public interests-here ranging from occupational safety and health, to conservation of government resources, to expeditious resolution of cases, to integrity of the judicial process. Specific public interests can fall into conflict with each other as well as with specific interests of employees at a particular worksite, and these larger conflicts can obscure the issues in individual cases. As a court we would do violence to our judicial responsibilities if we failed to recognize this, particularly if we failed to distinguish between the public interest in bureaucratic economy which grows primarily out of the Secretary's administrative function and the public interest in occupational safety and health which grows primarily out of the remedial purpose of the Act. We would violate our judicial obligation of neutrality if we ceded to the Secretary, on the ground of his amorphous "public interest" mandate, our independent duty to assure a full airing of all factual and legal issues necessary to resolution of a case.

Another factor which undoubtedly contributes to judicial reluctance to read section 10(c) expansively is that to do so is to disturb the "prosecutor-defendant" paradigm: there can be only one prosecutor; the Secretary is the prosecutor under the

---

48/ And it cannot be overemphasized that union participatory rights under LMRDA depend entirely on Fed.R.Civ.P. 24(a)(2), which limits participatory rights by permitting the parties already in the suit to argue in opposition to intervention, which requires the party seeking to intervene to justify its presence in the case, and which permits the court to apply its discretionary judgment before granting the intervening party the "right" to participate. Each of these limitations is precluded by the final clause of section 10(c) of the OSH Act.

Act; ergo, employees cannot take on prosecutorial functions. This however, is taking the word "prosecutor" entirely too literally and elevating form over substance. After all, Commission proceedings are only quasi-judicial in nature, and in large part the terms "prosecutor" and "prosecutorial function," in the context of this Act, have more to do with the idea of executive function than with courtrooms. As long as due process is preserved, there is no good reason for subsuming the purpose of the Act to legal jargon or technicalities.

VI

If neither prosecutorial discretion nor legislative intent demand limited employee participation with respect to settlement and withdrawal, one must ask: Is the purpose of the Act--to protect employee safety and health--best served by limiting employee participation in such matters?

To preclude employees from showing that an abatement plan is inadequate or that, contrary to the representations of a settlement agreement, abatement has not occurred, is to undermine

rather than advance the purpose of the Act. It is true that the Secretary can reinspect at a later date and cite the employer for failure to abate, but I agree with Commissioner Cottine's reasons why this is unsatisfactory. Moreover, if employees in a particular case are right, that the fact of abatement has been misrepresented or that an abatement plan is inadequate, to postpone discovery of that fact in order to preserve a legalistic and outmoded view of the prosecutorial function seems indefensible.

If the Secretary wishes to withdraw a citation, he can have only three reasons: He may decide a particular case is not worth the expenditure of agency resources; he may decide that the evidence is not good enough to win; he may decide that the legal issues raised ought to be decided at another time, in another context, for purposes of an overall enforcement strategy. If we examine these reasons from a pragmatic, rather than legalistic viewpoint, it is hard to see how it serves the purpose of the Act to keep employees out of settlement and withdrawal in at least two out of the three situations. If the Secretary's reason for wishing to withdraw is lack of resources, and the employees, acting through their authorized representative (generally a union), volunteer to take on the financial burden of proving a violation, does it serve the purpose of the Act to cry "exclusive, unreviewable prosecutorial discretion" and leave the dangerous condition uncorrected? If the

Secretary's reason for withdrawal is his judgment that the evidence is not good enough to establish a violation, and he is wrong, does it serve the purpose of the Act to prevent employees from proving that fact? If the evidence is as insufficient as the Secretary's preliminary assessment indicates, that fact will soon become apparent to the administrative law judge, probably fairly early in the proceedings.

We must not forget that sections 8(g) and 9(a), which mandate Secretary action only upon reasonable belief that a violation exists, have already operated as a screening process upon the matter and have indicated that a violation does exist.49/ Moreover the danger of employee abuse of participatory rights is significantly minimized by two factors: the economic realities which operate on employer pocketbooks operate on employee pocketbooks as well, and the Secretary's motion to dismiss will be decided by the administrative law judge in light of the quality of the employees' arguments.50/ IMC Chemical Group, Inc.,

---

49/ It is worth noting that Justice Douglas, in Trbovich v. United Mine Workers of America, supra, in agreeing with the majority that the Secretary's power to bring suit under the LMRDA is a "screening function," also said that the decision to bring suit exhausts the screening function.

Although the point has been made that a citation is issued by non-legal personnel acting with necessary dispatch, the complaint which follows is issued by legal personnel who at that point have the added benefit of the employer's notice of contest.

50/ Indeed, our actual experience is that employee assumption of prosecutorial function in Commission proceedings is both manageable and effective. In Eaton Corp., 78 OSAHRC 70/B14, 6 BNA OSHC 1905, 1978 CCH OSHD ¶ 22,942 (No. 76-1056, 1978), and Penn Central Transport. Co. and Daniel Tarasevich, 1976-77 CCH OSHD ¶ 20,832 (No. 11581, 1976), the Secretary announced his intention, immediately prior to the scheduled hearing, not to present evidence and moved to amend the citations to reduce the characterization of the violations to de minimis. The employees, acting through their authorized representatives, were permitted

78 OSAHRC 95/C14, 6 BNA OSHC 2075, 1976-77 CCH OSHD ¶ 21,514 (No. 76-4761, 1978), reversed, 635 F.2d 544 (6th Cir. 1980).

The third reason for prosecutorial restraint is somewhat different. If the Secretary's reason for withdrawing a citation is that prosecution of the particular case would interfere with an overall enforcement scheme, that would be sufficient ground for the Commission to grant the Secretary's motion to dismiss over the objections of the employees without a full airing of the employees' substantive contentions.

In the instant case, the argument is made that introduction of yet another stage in the adjudicatory process, i.e., an evidentiary hearing on employee objections to a settlement agreement, hampers employee safety and health by delaying if not actually foreclosing a legal duty to abate; no abatement is required while the parties dispute the abatement plan, and if the hearing ends in disapproval of the settlement agreement,

---

50/ (Continued)

to go forward with the evidence, and in each case successfully proved a violation and established that it was not de minimis. In Southern Bell Telephone & Telegraph Co., 82 OSAHRC 6/ , 10 BNA OSHC , 1982 CCH OSHD ¶ (No. 80-1195, 1982), the Secretary's motion to dismiss for lack of sufficient evidence was denied after the authorized employee representative indicated a willingness to assume the burden of proving the alleged violations. After a hearing at which the Secretary declined to present evidence and the employee representative presented testimony and exhibits, the citation was vacated on the merits. See also Gurney Industries, Inc., 74 OSAHRC 8/A2, 1 BNA OSHC 1218, 1971-73 CCH OSHD ¶ 15,684 (No. 722, 1973), in which the Commission held that it was abuse of discretion for the administrative law judge to grant the employer's motion to withdraw its notice of contest without considering the employees' proffer of evidence on the feasibility of abatement and the seriousness of the violation.

a final order against the Respondent may never issue.[51/] The implication is that even if the Secretary's abatement plan is less than perfect it will certainly achieve some improvement in employee safety and health and that a very real gain is being traded away for the chimera of perfect safety. This might be true if the focus of the hearing were whether and to what extent the employees' abatement plan is better than the Secretary's, but that is not the case. The question before the administrative law judge at such a hearing is not whether the employees' plan is better than the Secretary's plan, but whether the Secretary's plan comports with the purposes and objectives of the Act, in other words, whether it is adequate. In the case, as here, of a general duty clause violation, a plan will be deemed adequate if it renders the workplace free of the hazard. The employees' burden will be to prove that the agreement's averment of actual abatement is in fact not true or that the proposed

---

51/ My dissenting colleague takes particular note of the fact that the instant case is now four years old. I could not agree more that time is of the essence; no one could seriously argue against speedy resolution of OSHA cases. However, one must question the value of a final, enforceable order which is based on a settlement agreement which will not achieve abatement.

In any case, the question before us is a legal one--what, in light of the Act's legislative history and overall scheme, is the scope of section 10(c) of the Act? The question is not whether cases could be more quickly disposed of if employees were excluded from substantive participation in settlement. Moreover, in the instant case, the four year delay is not the result of anything the employees did or sought to do during settlement, but is the result of the fact that their right to be heard was placed in issue as a legal matter; had the fundamental question of employee rights not been in dispute, a final order in this case would undoubtedly have been issued long ago.

abatement method will not render the workplace free of the hazard. Therefore, the focus of the hearing will be not on the relative merits of the employees' and the Secretary's plan, but on whether the proposed abatement method(s) have rendered or will render the workplace free of the hazard.

A related argument is that a hearing on employee objections does not actually advance employee safety and health interests because it is, in fact, an exercise in futility. The terms of the challenged agreement represent the Secretary's best assessment both of the case and of his own resources, and if his abatement plan is disapproved he will not act to pursue the employees' views. However, as explained above, the settlement agreement will be disapproved only if the employees show that the proposed abatement methods are ineffective. To suggest that even in the face of such evidence the Secretary will refuse to negotiate further, or, in the event the employees take over the prosecutorial function and achieve a final order affirming the citation, he will subsequently refuse to issue a failure-to-abate order, is to assume that the Secretary will not act in good faith. There is no foundation for such an assumption.

ROWLAND, Chairman, dissenting:

More than four years ago, the Secretary of Labor and Mobil Oil Company entered into an agreement to end this litigation. As part of the agreement, Mobil promised to implement certain measures to protect its employees against the hazard the Secretary alleged to exist in Mobil's workplace. However, while the Commission has been deciding whether to approve the agreement, Mobil has been under no legal obligation to institute either these or any other measures to protect its employees against this allegedly serious hazard. Now, my colleagues[1/] further delay the entry of an abatement order by remanding this case so that the administrative law judge can consider whether additional measures sought by the union representing Mobil's affected employees are necessary to abate the violation.[2/] If so, then the judge must disapprove the settlement agreement. If this occurs, it is not clear what my colleagues expect the parties to do, but it is clear that the entry of the

---

1/ It may be presumptuous of me to read any majority views into the widely divergent separate views of my colleagues. Nevertheless, they both agree to dispose of this case in the same manner, and I must assume there is some common ground for their disposition.

2/ For the reasons stated infra, the facts of this case illustrate that resolving the merits of the Union's objection may be more easily said than done. The Union agrees with virtually the entire abatement plan submitted by the Secretary and Mobil. It disputes only that portion of the plan that provides for radio contact to be maintained with the gauger during what the parties refer to as the "less critical period" following the refloating of a roof. This period begins at least four hours after the roof has been refloated. Thus, the provision the Union objects to would only come into play after the most dangerous time for an employee to be on a roof has passed without incident. The Union contends that the provision is inadequate and seeks to have a second employee maintain visual contact with the gauger during the less critical period as well as during the earlier, more dangerous period.

abatement order will at best be further delayed and perhaps will never occur at all. This procedure is necessary, my colleagues assert, to serve the purpose of protecting employee health and safety.

In my opinion, my colleagues' disposition misconceives the role of the Commission in the Act's enforcement scheme, misconstrues the Act by giving employees broader "rights" than Congress explicitly gave them, and is inconsistent with the very objective of employee safety and health that my colleagues assertedly seek to advance.

A

The Occupational Safety and Health Act imposes mandatory requirements on employers and gives the Secretary broad enforcement powers.[3/] The Secretary is given the authority to promulgate occupational safety and health standards,[4/] inspect and investigate worksites,[5/] issue citations to employers he believes are in violation of the Act,[6/] prosecute contested citations before the Commission,[7/] seek enforcement of

---

3/ Section 5(a), 29 U.S.C. § 654(a), requires that employers comply with the general duty clause and with the occupational safety and health standards promulgated under the Act. Employers can be penalized for failing to do so. 29 U.S.C. § 666(a)-(c). Although section 5(b), 29 U.S.C. § 654(b), requires that employees comply with provisions applicable to their conduct, the Act does not provide for enforcement actions against employees. Nacirema Operating Co., 4 BNA OSHC 1393, 1976-77 CCH OSHD ¶ 20,879 (No. 12099, 1976). See Atlantic & Gulf Stevedores, Inc. v. OSHRC, 534 F.2d 541, 553-54 (3d Cir. 1976). Thus, the Secretary can bring enforcement actions against employers only.

4/ 29 U.S.C. §§ 655(a) and (b).

5/ 29 U.S.C. § 657(a).

6/ 29 U.S.C. § 658(a).

7/ 29 U.S.C. § 659(c).

Commission orders,[8] seek injunctions to counteract imminent dangers,[9] grant variances from standards,[10] and compromise, mitigate, and settle penalties.[11] The Commission's sole authority is to resolve disputes resulting from enforcement actions brought by the Secretary.[12]

Employees are given certain specific rights under the Act, such as the right to request an inspection of their workplace[13] and to accompany the inspector during the inspection.[14] They cannot, however, compel the Secretary to issue a citation and, with one exception, they cannot dispute the citation once it is issued. The exception involves the abatement date contained in the citation. Under section 10(c), 29 U.S.C. § 659(c), employees may contest before the Commission the reasonableness of the time permitted for abatement. Section 10(c) also gives employees the procedural right to participate as parties to Commission proceedings instituted by their employers.

Except for the right to challenge the abatement time, the Act gives employees only one other way in which they can question the Secretary's prosecutorial discretion. Section 13(d), 29 U.S.C. § 662(d), permits

---

8/ 29 U.S.C. §§ 659(b) and 660(b).

9/ 29 U.S.C. § 662(a).

10/ 29 U.S.C. § 655(d).

11/ 29 U.S.C. § 655(e).

12/ 29 U.S.C. § 659(c). A case may come before the Commission in three ways: (1) an employer may contest a citation or notification of proposed penalty; (2) employees may contest the period of abatement provided in a citation; and (3) an employer can seek a modification of an abatement date established by a Commission final order.

13/ 29 U.S.C. § 657(f)(1).

14/ 29 U.S.C. § 657(e).

an employee to seek a writ of mandamus in a federal district court if the Secretary arbitrarily and capriciously fails to seek an injunction to counteract an imminent danger. These two limitations on the Secretary's prosecutorial authority demonstrate that, where Congress intended for employees to question the Secretary's prosecutorial discretion, it explicitly provided that they could do so. Where Congress did not so provide, it did not intend to create a private right of action. Taylor v. Brighton Corp., 616 F.2d 256 (6th Cir. 1980).

Thus, the Act gives the Secretary broad prosecutorial authority, limited only by the right of employees to challenge an abatement date and by the right, which is not applicable to Commission proceedings, to seek a writ of mandamus in imminent danger situations. The procedural right of affected employees to become parties to Commission proceedings must be interpreted consistent with the overall enforcement mechanism the Act establishes, and therefore cannot be read to limit the Secretary's prosecutorial discretion in Commission proceedings except where the employees and the Secretary differ on the issue of the abatement date. The cases decided by the courts of appeals universally recognize this principle. In Marshall v. OSHRC (IMC Chemical Group, Inc.), 635 F.2d 544 (6th Cir. 1980), the court held that employees cannot object to the Secretary's decision to withdraw a citation. The Third Circuit has stated that the only objection an employee party can raise to a settlement agreement between the Secretary and an employer concerns any abatement date provided for in the agreement. Marshall v. Sun Petroleum Products Co., 622 F.2d 1176 (3d Cir.), cert. denied, 101 S. Ct. 784 (1980). The same court has held that employees may not contest the representation in a settlement agreement that abatement has occurred.

Marshall v. Oil, Chemical and Atomic Workers, 647 F.2d 383 (3d Cir. 1981). The D.C. Circuit has agreed with the Sixth and Third Circuits that employees cannot prosecute a citation the Secretary seeks to withdraw and cannot dispute the terms of a settlement between the Secretary and an employer. Oil, Chemical and Atomic Workers v. OSHRC, 671 F.2d 643, 650 (D.C. Cir. 1981), pet. for cert. filed, No. 81-1784 (March 26, 1982). The court further stated that, although an employee representative that has elected party status can appeal an adverse Commission decision to a court of appeals, such an appeal will be rendered moot if the Secretary informs the court that he will not further enforce the claim regardless of the court's disposition of the appeal. Id. at 651. My colleagues do not find these decisions persuasive.[15/] They prefer to read the final sentence of section 10(c) to give employees broad rights that are inconsistent with the Act's overall pattern. In my opinion, the courts are precisely correct in recognizing that the procedural right of employees to elect party status does not confer on them the right to challenge the Secretary's prosecutorial authority in Commission proceedings except on the specific issue of the abatement date.

---

15/ Commissioner Cottine notes that some courts have held that the charging party in an NLRB case is entitled to be heard on its objections to a settlement between the Board's General Counsel and the party charged with an unfair labor practice. Those decisions, however, have relied on the "unique legal status" of the charging party in an unfair labor practice proceeding, NLRB v. Oil, Chemical & Atomic Workers Int'l Union, 476 F.2d 1031, 1036 (1st Cir. 1973), and on the "overall legislative scheme" of the National Labor Relations Act, Concrete Materials of Georgia, Inc. v. NLRB, 440 F.2d 61, 67 (5th Cir. 1971). However, as I have noted, the courts that have considered the role of employee parties in the context of the overall legislative scheme of the Occupational Safety and Health Act have held that employee objections to settlement agreements are limited to the period of time allowed for abatement. Thus, the NLRB cases are inapposite.

Prosecutorial discretion serves a valuable purpose; it assures that a private person need not answer frivolous charges, but provides for a government agency to serve a screening function and decline to bring charges it determines have no merit.[16/] Trbovich v. United Mine Workers of America, 404 U.S. 528, 537; Taylor v. Brighton Corp., 616 F.2d at 262. Moreover, this screening function does not cease when the Secretary issues a citation. As Commissioner Cleary has pointed out, citations are issued by the Secretary's nonlegal personnel acting with necessary dispatch. Donald K. Nelson Construction, Inc., 76 OSAHRC 2/A2, 3 BNA OSHC 1914, 1975-76 CCH OSHD ¶ 20,299 (No. 4309, 1976). Thus, the Secretary's attorneys normally do not assess the justification for a citation until the citation is issued and is contested. At that time, they are obligated to review the matter to determine whether the citation should be prosecuted. See Rule 11 of the Federal Rules of Civil Procedure. Moreover, this screening function continues throughout a case. As prosecuting attorneys representing the United States government, the Secretary's attorneys have a continuing duty to see that justice is done.

> The United States Attorney is the representative not of an ordinary party to a controversy, but of a sovereignty whose obligation to govern impartially is as compelling as its obligation to govern at all; and whose interest, therefore, in a criminal prosecution is not that it shall win a case, but that justice shall be done. As such, he is in a peculiar and very definite sense the servant of the law, the twofold aim of which is that guilt shall not escape or innocence suffer.

---

16/ Even if a person is ultimately vindicated, the necessity to answer and defend a charge imposes a substantial burden on the accused party. Indeed, it was concern for the burden imposed by the need to simply defend a charge that led Congress to enact the recent Equal Access to Justice Act, 28 U.S.C. § 2412, which provides that certain parties who prevail in suits against the government may be awarded attorney fees and expenses if the government's position was not substantially justified.

Berger v. United States, 295 U.S. 78, 88 (1935).[17/] Although this statement was made in a criminal case, its rationale obviously applies equally to any proceeding, such as this, in which the government is prosecuting a private party for allegedly violating the law and the party can be penalized if found in violation.

B

One of the principal controversies that arose during the congressional debates was whether adjudicatory authority should be vested in the same agency, the Secretary of Labor, responsible for prosecuting contested actions or whether a separate, independent agency should be established for the adjudication of disputes. The Act was considered first by the Senate, whose Committee on Labor and Public Welfare reported to the floor a bill, S. 2193, that gave adjudicatory as well as prosecutorial authority to the Secretary.

The Committee minority, however, favored an independent panel to adjudicate disputes. Senator Javits explained the rationale for the minority view:

> [H]earing and determination of enforcement cases by an independent panel more closely accords with traditional notions of due process than would hearing and determination by the Secretary. In the latter case the Secretary is essentially acting as prosecutor and judge. Any finding by the Secretary in favor of a respondent would be essentially a repudiation by the Secretary of his own Department's employees. While this type of enforcement has been used in connection with other statutes, is contemplated by the Administrative Procedure Act, and is not jurisdictionally defective on due process grounds,

---

17/ I do not agree with my colleagues that the Secretary cannot be relied upon to adequately represent the public interest. I have no reason to believe that the Secretary's concern for the public interest is any less than that of this Commission.

> the awkward mechanics it imposes upon heads of Departments who wish to exercise their adjudicatory power personally in order to preserve due process has not generally been appreciated.

Senate Subcommittee on Labor, 92d Cong., 1st Sess., Legislative History of the Occupational Safety and Health Act of 1970 at 195. Consequently, on the floor of the Senate, Senator Javits introduced an amendment to S. 2193, which was ultimately adopted and established the Commission as an independent adjudicatory agency.

The House of Representatives also considered a committee bill, H.R. 16785, which vested both prosecutorial and adjudicatory authority in the Secretary of Labor, and a substitute bill, H.R. 19200, which established an independent commission to adjudicate contested enforcement actions. The substitute bill was passed as an amendment to the committee bill. Thus, Congress established this Commission because it was concerned that placing adjudicatory as well as prosecutorial authority in the Secretary of Labor would be unfair to employers who were subject to enforcement actions brought by the Secretary. See Taylor v. Brighton Corp., 616 F.2d at 260-61. The Commission was not given any policy-making role, any prosecutorial powers, or any authority to oversee the Secretary's exercise of his prosecutorial discretion. Marshall v. Sun Petroleum Products Co., 622 F.2d at 1183-84. Indeed, asserting such powers would necessarily detract from the impartiality that provided the very reason for Congress to create the Commission. See Dale M. Madden Construction, Inc.v. Hodgson, 502 F.2d 278 (9th Cir. 1974).

C

Informal dispositions are the "lifeblood of the administrative process." Local 282, International Brotherhood of Teamsters v. NLRB, 339 F.2d 795, 797 (2d Cir. 1964). This principle holds true under the Occupational Safety and Health Act. If every dispute between the Secretary and employers had to be resolved through litigation, the Act's enforcement machinery would be overburdened, with even longer delays in the disposition of cases than now exist.[18/] And since any abatement requirement is tolled pending the entry of a Commission final order when an employer contests a citation in good faith,[19/] there would be long delays in achieving abatement in those situations ultimately found by the Commission to be in violation of the Act.

Thus, settlements play a vital role in the Secretary's ability to enforce the Act. They enable him to allocate his resources efficiently while achieving rapid entry of abatement orders. However, settlements involve an element of compromise, and the Secretary may be unable to achieve all he seeks in a settlement agreement. Nevertheless, when he balances the concessions he must make against the conservation of his resources, the swift entry of an abatement order, and the possibility he may lose in litigation, he might well conclude that a settlement ful-

---

18/ As noted above, this case has been before the Commission for more than four years. Other cases have been here even longer. The Commission's backlog would be even worse but for the fact that a substantial number of cases are disposed of by the consent of the parties. For example, Commission records reveal that, in fiscal 1981, 92.7% of case dispositions by Commission administrative law judges occurred prior to a hearing. These dispositions include settlements, withdrawals of citations by the Secretary, and withdrawals of notices of contest by employers.

19/ 29 U.S.C. § 659(b).

fills the purposes of the Act even if its terms are not those he would regard as optimum.

My colleagues remand this case for the judge to second-guess the Secretary and decide whether the settlement agreement between the Secretary and Mobil fulfills the purposes of the Act. In making this determination, the practical considerations that may have induced the Secretary to agree to the settlement apparently must be ignored. Instead, the judge is to hold some type of hearing at which the Union presents its objections to the agreement and, on the basis of whatever information the parties present to him, determine whether the abatement plan in the agreement is inadequate.[20/] If the judge believes that the Secretary's plan is inadequate, he must disapprove the settlement agreement.[21/]

---

20/ At various places in my colleagues' opinions, they imply that the judge will encounter little difficulty in making this determination. That is only true if, as I suspect, they expect the judge to simply compare the Union's abatement proposal with that of the Secretary and Mobil and see which appears to offer more protection. However, a serious inquiry into an employer's abatement responsibility under a broad requirement such as § 5(a)(1) is not a simple task. See National Realty and Constr. Co. v. OSHRC, 489 F.2d 1257, 1266-67 (D.C. Cir. 1973). Normally, the Commission determines whether an employer's precautions were sufficient to free its workplace from a hazard when an employer contests a citation or a failure to abate notification. However, when the Commission does so, it has the benefit of a complete evidentiary record made after the employer's precautions have been implemented and their effectiveness, or lack thereof, demonstrated. See BASF Wyandotte Corp., 81 OSAHRC , 10 BNA OSHC 1250, 1982 CCH OSHD ¶ 25,831 (No. 78-2316, 1981) (employer's precautions against explosion hazard were sufficient; additional precautions sought by the Secretary are therefore not required). In contrast, assuming that my colleagues expect the judge to conduct a serious inquiry into the adequacy of the abatement plan contained in the settlement agreement, they expect him to do so in some type of proceeding whose nature is not clear but is apparently something other than a full evidentiary hearing. Indeed, it does not appear that my colleagues even agree on the nature of this proceeding.

21/ On its face, the provision in the Union's plan for continuous visual contact with the gauger appears to provide more protection than the plan for radio contact at ten-minute intervals contained in the settlement

(continued on next page)

If the judge disapproves the settlement agreement, the Secretary must then decide whether to abide by the agreement or withdraw from it. If he abides by the agreement, he cannot obtain an enforceable order. He may also not be able to obtain an enforceable order if he withdraws from the agreement. One court has persuasively held that "dictates of fairness and justice require that all parties be placed in the position of status quo ante the issuance of the citation" if the Secretary withdraws from a settlement. Marshall v. Sun Petroleum Products Co., 622 F.2d at 1187.

If the Secretary nevertheless attempts to withdraw from the agreement and litigate the case on the merits, the burden is on him to prove a violation, and he may be unable to satisfy that burden. In such a situation, Mobil would have no abatement obligation at all, and the Secretary loses the benefits he would have gained through the settlement. If the Secretary sustains his burden of proof, then Mobil will be required to abate the violation.[22/] However, only the Secretary can issue a failure to abate

---

21/ (continued)

agreement. See note 2 supra. However, it is not clear that a recognized hazard likely to cause death or serious harm to employees would remain after implementation of the Secretary's abatement plan. An intelligent inquiry into the adequacy of the Secretary's abatement plan must address in detail the nature of the hazard during the less critical period. Thus, the Secretary may be unable to persuade the judge that his plan is adequate without extensive litigation, which is what he sought to avoid by settling the case in the first place.

22/ When the Commission finds, in a case litigated on its merits, that an employer violated the Act as alleged in a citation, it enters an order affirming the citation. The Commission has never included in its order a specific abatement method an employer must follow. See United Auto Workers, Local 588 (Ford Motor Co.), 76 OSAHRC 58/B8, 4 BNA OSHC 1243, 1976-77 CCH OSHD ¶ 20,737 (No. 2786, 1976), aff'd, 557 F. 2d 607 (7th Cir. 1977) (Commission lacks authority to order employer to institute specific abatement

(Continued on next page)

notification, which Mobil can avoid by taking whatever abatement measures are satisfactory to the Secretary. Thus, even if the Union and the Commission disagree with the adequacy of the abatement measures sought by the Secretary, it is futile for them to suggest that an employer must do more than the Secretary believes is necessary, for it is within the Secretary's sole discretion to decide whether to issue a failure to abate notification to an employer.

Thus, the disposition ordered by the majority imposes substantial burdens on the Secretary and Mobil while producing benefits to nobody. This absurd result illustrates the anomaly of the Commission, a purely adjudicatory agency, interfering in matters that lie within the Secretary's prosecutorial discretion. It further illustrates the wisdom of the court decisions that have recognized that the right of employees to elect party status cannot be interpreted as a limitation on the Secretary's prosecutorial discretion except where the abatement date is an issue.[23/] This Commission has enough to do without assuming

---

22/ (continued)

measures); Brown & Root, Inc., 80 OSAHRC 97/A2, 8 BNA OSHC 2140, 2144, 1980 CCH OSHD ¶ 24,853 at p. 30,656 (No. 76-1296, 1980) (employer may abate violation by any method it chooses that is sufficiently effective). Therefore, in my view, even if the Union persuades the judge that the abatement plan in the settlement agreement is inadequate, the Commission cannot require the employer to follow the particular plan of abatement proposed by the Union.

23/ Commissioner Cottine's observation that the Commission has rarely disapproved settlement agreements is inapposite. Until today, the Commission and its administrative law judges would not consider employee objections to abatement plans in settlement agreements under the Commission precedent the majority overrules. United States Steel Corp., 77 OSAHRC 12/C3, 4 BNA OSHC 2001, 1976-77 CCH OSHD ¶ 21,463 (No. 2975, 1977). However, while this case has been under consideration, a number

(continued on next page)

powers that Congress did not give it. I would affirm the judge's order approving the settlement agreement.

---

23/ (continued)

of other cases involving employee objectons to settlement agreements have accumulated in the Commission's backlog. Therefore, it is not accurate to say that such objections occur only rarely. Moreover, we obviously do not know in how many cases employees refrained from raising objections to settlement agreements because the administrative law judge could not consider the objections under United States Steel Corp., supra. Finally, we do not know how many cases may not be settled because of the possibility this decision creates that the settlement may not be approved.

The Petroleum Trades Employees Union, Local 419 ("PTEU") seeks to have not approved the Stipulated Settlement executed by Complainant and Respondent on May 31, 1978. Its request must be denied.

So far as relevant the facts are these: By Citation and Notification of Penalty dated November 30, 1977 (the "Citation"), Respondent was charged with a violation of section 5(a)(1) of the Occupational Safety and Health Act of 1970 (the "Act") at its Port Mobil, Staten Island facility. Respondent timely filed its notice of Intent to Contest the Citation and the proposed assessment of penalty.

A complaint was issued by the Secretary of Labor on January 12, 1978, alleging that Respondent had violated the Act as alleged in the citation. Respondent timely filed an answer denying that it had violated the Act and raising certain affirmative defenses.

The case was scheduled to be tried on April 14, 1978. Prior to that date, following several months of extensive negotiations, the Secretary and Respondent executed a stipulated settlement resolving all issues in dispute. On March 10, 1978, the Court advised the parties in writing that it had been informed the case had been settled and that it had cancelled the hearing.

By letter dated March 16, 1978, Richard Lewicki, President of PTEU, gave notice of intent to participate in the case as the certified bargaining agent for the affected employees at Respondent's Port Mobil facility. On March 23, 1978, the Court granted PTEU, the authorized employee representative, party status. A copy of the stipulated settlement was mailed to Lewicki by Respondent on March 28, 1978, and was posted by Respondent at its Port Mobil facility.

By letter dated March 31, 1978, from the OSHA Regional Solicitor, Respondent was advised that the Secretary had decided not to submit the previously agreed upon stipulated settlement to the Court for approval. On April 17, 1978, Respondent filed a motion to compel submission of the stipulated settlement. PTEU filed an affidavit in opposition to Respondent's motion. The Secretary was granted an extension of time for responding to Respondent's motion in order further to pursue settlement of the case.

Thereafter, following further discussions, a second stipulated settlement was submitted to Respondent by the Secretary on May 18, 1978. In capsule it recites that the violations have been abated and sets forth in detail the training and gauging procedures for external floating roof tanks that Respondent shall follow.

On May 25, 1978, PTEU advised the Court in writing that it did not agree with the second stipulated settlement and requested a hearing.

An informal pre-trial conference was held on May 31, 1978 at which counsel for all parties appeared. At the conference the Secretary and Respondent executed the second stipulated settlement and submitted it to the Court for its approval, a copy was given to PTEU's counsel. PTEU's application for a hearing was granted.

Oral argument on the question of whether or not the stipulated settlement should be approved was heard on June 6, 1978. PTEU did not challenge the reasonableness of the abatement date and conceded that the Commission has held that an employee contest is limited to the reasonableness of an abatement period. However, it argued that even though Respondent has abated the violative condition the stipulated settlement should nevertheless not be approved because (a) it failed to require that <u>at all times</u> when an employee is engaging in gauging activities a second person must be immediately available at the tank gauging platform where he will maintain visual contact with the gauger and (b) the reliance on combustible gas/oxygen sufficiency detectors alone under conditions named in the stipulated settlement is misplaced. As an alternative PTEU offered to agree to the stipulated agreement if paragraph 10, item c, were modified to require radio communication

between the employee engaging in gauging activities and a second person (not in visual contact) every five minutes instead of ten. The offer was rejected by the Respondent and the Secretary.

The Secretary and Respondent rely on Commission rulings limiting the employees participation.

The rights of employees or their representatives to participate as parties to hearings under the Act is set out in section 10(c) of the Act (29 U.S.C. § 659(c)) which provides that:

> "If an employer notifies the Secretary that he intends to contest a citation issued under section 658(a) of this title or notification issued under subsection (a) or (b) of this section, or if, within fifteen working days of the issuance of a citation under section 658(a) of this title, any employee or representative of employees files a notice with the Secretary alleging that the period of time fixed in the citation for the abatement of the violation is unreasonable, the Secretary shall immediately advise the Commission of such notification, and the Commission shall afford an opportunity for a hearing (in accordance with section 554 of Title 5 but without regard to subsection (a)(3) of such section). The Commission shall thereafter issue an order, based on findings of fact, affirming, modifying, or vacating the Secretary's citation or proposed penalty, or directing other appropriate relief, and such order shall become final thirty days after its issuance. Under a showing by an employer of a good faith effort to comply with the abatement requirements of a citation, and that abatement has not been completed because of factors beyond his reasonable control, the Secretary, after an opportunity for a hearing as provided in this subsection, shall issue an order affirming or modifying the abatement requirements in such citation. The rules of procedure prescribed by the Commission shall provide affected employees or representatives of affected employees an opportunity to participate as parties to hearings under this subsection." (Emphasis added.)

In Secretary v. Local 588, United Auto Workers, (Ford Motor Co.) OSAHRC Docket No. 2786, May 25, 1976, aff'd 557 F.2d 607 (7th Cir. 1977) the Commission[1/] concluded that an employee contest of an abatement period under this section is limited to the reasonableness of the abatement period and does not extend to the sufficiency of the abatement plan submitted by the employer. To the same effect is Secretary v. Southern Bell,[2/] Docket No. 10340 (May 1977) 5 OSHC 1405.

The precedent established by the Commission, and upheld by the Circuit Court of Appeals, is controlling and must be followed. Continental Steel Corp. v. Secretary, 10 OSAHRC 93, 94-95 (and the case cited therein). Accordingly, the posture of PTEU is untenable and is rejected.

The settlement agreement filed by the Secretary and the Respondent on May 31, 1978 is approved, the motions contained therein are granted and Respondent's notice of contest and that of the PTEU are dismissed.

Citation 1, serious, for violation of section 5(4)(1) of the Act (29 U.S.C. 654) as amended by changing the substantive abatement provisions and reducing the proposed penalty is affirmed.

---

1/ Commissioner Cleary dissented.

2/ ibid.

Abatement shall accord with the provisions of the settlement agreement.

A penalty of $400.00 is assessed.

SO ORDERED.

EDWARD V. ALFIERI
JUDGE, OSHRC

Dated: July 6, 1978
New York, New York

## NOTICE OF DECISION

Secretary of Labor v. NATIONAL STEEL AND SHIPBUILDING COMPANY
OSHRC Docket No. 80-4827

1. Enclosed is a copy of my decision. It will be filed with the Commission on July 6, 1982, and will become the final order of the Commission on August 5, 1982, unless a Member of the Commission directs that it be reviewed.

2. You may petition for discretionary review of this decision by the Commission. A petition may be filed directly with me within twenty (20) days from the mailing of my decision. Thereafter, a petition should be mailed to the Executive Secretary, Attention:

   Chief Review Counsel
   Occupational Safety and Health Review Commission
   1825 K Street, N.W., Suite 601
   Washington, D.C. 20006.

   Any petition filed directly with the Commission will be considered to the extent that time and resources permit. The last day the Commission may consider your petition is August 5, 1982. This final order date is fixed by law and cannot be extended under any circumstances.

3. If review is ordered by a Member of the Commission, each party to this case will be notified. In addition, each party will be given an opportunity to submit a brief to the Commission.

4. Please complete the enclosed postcard indicating whether you presently intend to seek review of this decision and mail the completed card promptly. Your response does not bind you in any way, but it assists the Commission in processing your petition when it is filed.

5. For any further details on the review process, see Commission Rules 90, 91, 92, and 93.

Sidney J. Goldstein
Judge, OSHRC

| SECRETARY OF LABOR, | : | |
| Complainant, | : | |
| v. | : | OSHRC Docket No. 80-4827 |
| NATIONAL STEEL AND SHIPBUILDING COMPANY, | : | |
| Respondent. | : | |

## DECISION

This is an action under Section 10(c) of the Occupational Safety and Health Act of 1970 brought by the Secretary of Labor against the National Steel and Shipbuilding Company to affirm two items of a Repeat Citation that alleged the Company violated regulations promulgated under the Act relating to housekeeping and to guarding of deck openings. The matter arose after a Compliance Officer for the Occupational Safety and Health Administration inspected a worksite of the Respondent, concluded that it was in violation of the two regulations, and recommended that the Repeat Citation and proposed penalty be issued.

The Repeat Citation describes the infraction in the following terms:

> 1. Staging platform(s), ramp(s), stairway(s), aisle(s) and passageway(s) on vessel(s) or drydock(s) were not kept clear of all tool(s), material, equipment or debris.
>
> LOCATION: Hull 7415, #6 Starboard wing tank near frame 53

in violation of the standard found at 29 C.F.R. 1919.51(a) which provides:

> Section 1916.51 Housekeeping
>
> (a) Good housekeeping conditions shall be maintained at all times. Adequate aisles and passageways shall be maintained in all work areas. All staging platforms, ramps, stairways, walkways, aisles and passageways on vessels or drydocks shall be kept clear of all tools, materials, and equipment except that which is in use, and all debris such as welding rod tips, bolts, nuts, and similar material. Hose and electric conductors shall be elevated over or placed under the walkway or working surfaces or covered by adequate crossover planks.
>
> 2. Manhole(s) or other comparable small opening(s) in the deck or other working surface(s) were not suitably covered or guarded.
>
> LOCATION: Hull 7415, #5 Inboard Starboard Tank forward at frame 47

in violation of the standard at 29 C.F.R. 1916.43(a) providing:

> Section 1916.43 Guarding of deck openings and edges
>
> (a) When employees are working in the vicinity of flush manholes and other small openings of comparable size in the deck and other working surfaces, such openings shall be suitably covered or guarded to a height of not less than 30 inches, except where the use of such guards is made impractible by the work actually in progress.

After a Notice of Contest, a Complaint and Answer were filed with this Commission, and a hearing was held by Judge Jerry Mitchell in San Diego, California. Before Judge Mitchell could issue a decision, he was separated from the service of this Commission because of budgetary considerations. The matter was then reassigned to me. At the suggestion of counsel for the Respondent, a non-evidentiary hearing was held to enable the parties to explain their positions.

The facts in this case disclose that the Respondent was engaged in shipbuilding operations in the San Diego area. A Compliance Officer

for the Administration inspected the worksite, spoke briefly with some employees, and photographed two alleged violations of standards adopted by the Administration.

At the hearing the Compliance Officer testified he saw planking and a welding lead on the floor of the scaffolding where a welder was working. The Officer considered the planking to be unused, and this lumber and a welding lead constituted a tripping hazard.

Respondent's employees disputed the conclusions of the Compliance Officer. They testified that the planking was on the floor of the scaffold preparatory for use in secondary scaffolding. At one time planking for secondary scaffolding was accomplished by hoisting the heavy lumber by hand, a practice considered relatively unsafe. In recent times the planking was placed on the floor of the original scaffold as found by the Compliance Officer. To avoid a tripping hazard, the planking was secured and the ends were painted a light yellow as reflected in the photographs. No employee was ever injured by tripping over the planks. Scaffolding, initially and secondarily, was a continuous process. Company practice was to erect guardrails as quickly as possible after scaffolding was in place and before employees were permitted to work on it.

On the basis of the foregoing summary of the record with respect to housekeeping, I place more reliance upon the observations of Respondent's employees as compared with the Compliance Officer. The latter had no experience with shipbuilding operations other than three inspections involving the Respondent. From the testimony it appears that he spent

but ten minutes on the premises and had little opportunity to discuss his findings with management personnel. On the other hand the Respondent's witnesses were veteran employees in the ship construction field and highly experienced in their assignment. Their testimony was to the effect that the planking was secure and in preparation for secondary scaffolding, and that no one considered the lumber to be a tripping hazard. From my study of the photograph depicting the scaffolding, I conclude also that there was no hazard in the storage of the planking while awaiting further use. I agree that it would be far safer to have the planking handy and elevated when needed for secondary scaffolding than to have the lumber hoisted to its new position. So far as the planking is concerned, I do not believe any hazard has been demonstrated.

I take a different view in connection with the welding lead. In this respect the last sentence of the regulation in question provides that hose and electric conductors shall be elevated over or placed under the walkway or working surfaces or covered by adequate crossover planks. An examination of the picture of the alleged housekeeping violation discloses that the welding lead was on the floor of the scaffolding and thus constituted a violation of this portion of the regulation.

This conclusion is in harmony with a decision of the Commission in Secretary of Labor v. FMC Corporation, OSHRC Docket No. 12311, June 6, 1979, 7 BNA OSHC 1419; 1979 CCH OSHD 23,631 p.28,654. There a Citation alleged that the company failed to maintain good housekeeping in that hoses were on deck, on walkways, and working areas at different locations throughout the ship. The Company defended on the ground that the tools, materials and

equipment were in use. The Commission found unpersuasive general testimony that it was possible that some objects may have been in use. Moreover, the Commission ruled that the "in use" exception did not apply to hose and electric conductors, and that, under the standard, hoses must be elevated or covered regardless of whether they are in use.

From the photograph it is apparent that the welder's hose was not elevated; nor did it otherwise meet the test of the last sentence of Section 1916.51(a). It follows that Item 1 of the Citation cannot be vacated. There is no dispute that a previous Citation under the same section of the regulations issued to the Respondent on July 30, 1979, alleging that cables and cords were scattered over the working area was not contested and now is a final order of the Commission. This infraction must be considered as Repeat in nature. Thus Item 1 of the Citation in the instant matter is affirmed as a Repeat Citation.

The Compliance Officer also photographed the alleged violation of a regulation found at 29 C.F.R. 1916.43(a) relating to the guarding of deck openings. No one was on the scaffolding at the time. This picture illustrates a space approximately 21 x 31 inches between the scaffolding and the skin or side of the ship under construction. Indeed there was a series of such spaces along the length of the scaffold. The Officer was of the opinion that an employee could fall into this space and suffer injury. He also thought that the openings could have been covered and the hazard thus eliminated.

As previously mentioned, the regulation provides that when employees are working in the vicinity of flush manholes and other small openings

of comparable size in the deck or other working surfaces, such openings shall be suitably covered or guarded. The Complainant alleges that the spaces between the scaffolding and the side of the ship fell within the meaning of such manholes as provided by the regulation, but the Respondent contends that the regulation is confined to manholes or similar small openings. It urges that a literal interpretation of the standard is in order, and that therefore the space between the scaffold and the ship is not a flush manhole or other small opening in the floor of the deck.

I conclude that the Respondent's view of the meaning of the regulation at 1916.43(a) is the more reasonable one. By its terms the regulation is concerned with holes in the floor, not spaces between the ship and scaffold. Even if a scaffold could be considered to be a working surface, there was no manhole or small opening on its floor. Thus construed, it is not necessary to discuss whether or not the Complainant established that employees were working in the vicinity of the openings.

The alleged hazard involved in this item of the Repeat Citation is the open space between the scaffold and the bulkhead. Since the standard in issue makes no reference to such an open area, the regulation was not violated. This item of the Repeat Citation is vacated.

In summary, I find that a welder's hose was not elevated over or placed under a working surface or covered by adequate crossover planks. In as much as there is no dispute with respect to the amount of the penalty proposed by the Secretary, this portion of the Repeat Citation is affirmed. I also find that there was no flush manhole or other small opening on the working surface of the scaffold.

It is also concluded that at the time mentioned in the Repeat Citation the Respondent was an employer within the meaning of Section 3 of the Occupational Safety and Health Act of 1970; that the Occupational Safety and Health Review Commission has jurisdiction over the parties and subject matter; that the Respondent was in violation of the standard found at 29 C.F.R. 1916.51(a); and that the Respondent was not in violation of the standard found at 29 C.F.R. 1916.43(a).

Based upon these findings of fact and conclusions of law, it is ordered that Item 1 of the Repeat Citation dated July 30, 1980, and the proposed penalty thereof, be AFFIRMED; and that Item 2 of this Citation be VACATED.

Sidney J. Goldstein
Judge, OSHRC

Project Manager
Omni Construction, Inc.
Rockville, Maryland

For the Respondent

USHER, Judge:

These proceedings were initiated by the Secretary of Labor, United States Department of Labor, pursuant to Section 10(c) of the Occupational Safety and Health Act of 1970 (29 U.S.C. 651, et seq., hereinafter referred to as the Act).

Complainant seeks affirmance by the Review Commission of two Citations which charge two "serious" and two "other than serious" violations of Section 5(a)(2) of the Act, and seeks

further to have the Commission assess penalties totaling $980 for these alleged violations.

Complainant has filed a Motion to Dismiss Respondent's Notice of Contest "as untimely". For the reasons set forth below, I agree with his position, and Complainant's motion will be granted.

An agent of Complainant's Occupational Safety and Health Administration (hereinafter referred to as OSHA) conducted an inspection of a worksite maintained by Respondent at 1001 22nd Street, N.W., Washington, D.C., on October 28-30, 1981, and issued two Citations to Respondent, dated November 6, 1981. These Citations and a Notification of Proposed Penalty were received (via certified mail) by Respondent's agent on December 24, 1981.1/

Respondent does not dispute the assertion that the Citations were received at its Rockville, Maryland, office on December 24, 1981. During the first or second week of January, 1982, Respondent's Project Manager and one of its Vice Presidents conferred regarding the receipt of the Citations and "decided to pursue it", but neither they nor anyone else on Respondent's behalf filed a Notice of Contest at that time as required by the provisions of Section 10(a) of the Act.2/

---

1/ Neither party has offered an explanation for the delay (November 6 to December 24, 1981) in the receipt of the Citations, but, when taken with the pertinent facts surrounding the resulting failure of Respondent to file its Notice of Contest, that question appears inconsequential.

2/ Section 10(a) of the Act provides, in pertinent part:

> If, after an inspection or investigation, the Secretary issues a citation under section 9 (a), he shall, within a reasonable time after the termination of such inspection or investigation, notify the employer by certified mail of the penalty, if any, proposed to be assessed under section 17, and that the employer has fifteen working days within which to notify

(Continued)

It seemingly was Mr. Frew's responsibility to initiate such action. Mr. Frew vacationed away from Respondent's offices sometime in early February, 1982, but not during the period from December 24, 1981, until January 18, 1982. He contacted OSHA for the first time in February to arrange an informal conference, and he conferred informally with Mr. Gilbert L. Esparza, OSHA's Area Director, on February 17, 1982. Mr. Esparza informed Mr. Frew that there was nothing he could do regarding the Citations in view of Respondent's failure to file a timely Notice of Contest as required by the provisions of Section 10(a) of the Act. Mr. Frew was told at that time that the Citations and Notification of Proposed Penalty had become final orders of this Commission by operation of the law. Mr. Frew nevertheless filed a "request [for] a late contest hearing to review the . . . citation[s]". That request was dated February 18, 1982.

Respondent's request was forwarded to the Review Commission by Complainant's agent, and the Review Commission assumed jurisdiction. J.I. Hass Co., Inc. v. OSHRC, et al., 648 F.2d 190 (3 Cir. 1981). A pretrial hearing was held at Washington, D.C., on May 17, 1982, and testimony was adduced by the parties.

The facts are not in dispute. Regardless of when they were mailed by Complainant, Respondent received the Citations and Notification of Proposed Penalty on December 24, 1981. The fifteenth

---

2/ (Continued)

> the Secretary that he wishes to contest the citation or proposed assessment of penalty. If, within fifteen working days from the receipt of the notice issued by the Secretary the employer fails to notify the Secretary that he intends to contest the citation or proposed assessment of penalty, and no notice is filed by any employee or representative of employees under subsection (c) within such time, the citation and the assessment, as proposed, shall be deemed a final order of the Commission and not subject to review by any court or agency. (Emphasis added.)

working day after that was January 18, 1982. Respondent did not file a Notice of Contest within that time period. Its failure to do so was not "caused by" Complainant's "deceptive practices [or] failure to comply with procedures required by the Act". Atlantic Marine, Inc. et al. v. OSHRC, et al., 524 F. 2d 476 (5 Cir. 1975). Likewise, its inaction was not the result of a "mistake, inadvertence, suprise, or excusable neglect" as those terms are used in Rule 60(b)(1), Federal Rules of Civil Procedure. See Secretary of Labor v. Monroe and Sons, Inc., et al., 615 F.2d 1156 (6 Cir. 1980.[3/]

There is no argument by Respondent concerning whether the person charged with responsibility for acting on the Citations knew or should have known of their issuance (Buckley & Company,Inc. v. Secretary of Labor, 507 F. 2d 78 (3 Cir. 1975)). Mr. Frew knew about the OSHA inspection, knew that the Citations had been issued, discussed them with a corporate vice president, and was fully aware of the 15-day statutory requirement for filing the Notice of Contest - all before embarking on his vacation, but he did nothing to ensure that Respondent's rights were protected. That was a mistake on his part, undoubtedly neglect or inadvertence, but hardly "excusable" as that term has been applied by the Courts.

---

3/ There is disagreement among the circuits regarding whether Rule 60(b)(1) of the Federal Rules of Civil Procedure may be applied in the face of the explicit language of Section 10(a) of the Act (Fn.2, supra.) or Section 12(j) of the Act, as the case may be. See Secretary of Labor v. OSHRC, et al., 502 F. 2d 30 (5 Cir. 1974).

## FINDINGS OF FACT

1. As the result of an inspection by his agent on October 28-30, 1981, at a worksite maintained by Respondent at 1001 22nd Street, Washington, D.C., Complainant issued two Citations and a Notification of Proposed Penalty which were received by Respondent on December 24, 1981, and were made known to its responsible officials.

2. Respondent did not file its Notice of Contest until February 18, 1982, more than 15 working days after its receipt of the Citations and Notification of Proposed Penalty.

3. Respondent's failure to file its Notice of Contest was occasioned by neglect on the part of its responsible officials and was not due to any action or inaction on the part of Complainant or his agents.

4. Respondent's neglect (as mentioned in Finding of Fact No. 3) was not excusable neglect (or a mistake or inadvertence) as that term is used in Rule 60(b)(1) of the Federal Rules of Civil Procedure.

## CONCLUSIONS OF LAW

1. Jurisdiction of the parties and of the subject matter herein is conferred upon the Occupational Safety and Health Review Commission by Section 10(c) of the Act.

2. At all times relevant hereto, Respondent was an employer engaged in a business affecting commerce within the meaning of

Section 3(5) of the Act and as such was subject to the requirements of Section 5(a)(2) of the Act.

3. In the absence of a Notice of Contest, filed by Respondent within 15 working days of its receipt of the Citations and Notification of Proposed Penalty on December 24, 1981, the Citations and Notification of Proposed Penalty became final orders of this Commission on January 18, 1982.

## ORDER

Upon consideration of the foregoing findings and conclusions, it is hereby ORDERED that Complainant's Motion to Dismiss Respondent's Notice of Contest, filed on February 18, 1982, is GRANTED; the Citations and Notification of Proposed Penalty, issued by Complainant to Respondent on November 6, 1981, are AFFIRMED; and a penalty of $980 is ASSESSED.

BENJAMIN G. USHER
JUDGE, OSHRC

# OCCUPATIONAL SAFETY AND HEALTH REVIEW COMMISSION

420 U. S. COURTHOUSE
POST OFFICE SQUARE
BOSTON, MASSACHUSETTS 02109

## NOTICE OF DECISION

Secretary of Labor v. Andreassi Brothers, Inc.
OSHRC Docket No. 80-6222

1. Enclosed is a copy of my decision. It will be filed with the Commission on August 2, 1982, and will become the final order of the Commission on September 1, 1982, unless a Member of the Commission directs that it be reviewed.

2. You may petition for discretionary review of this decision by the Commission. A petition may be filed directly with me within twenty (20) days from the mailing of my decision. Thereafter, a petition should be mailed to the Executive Secretary, Attention:

   Chief Review Counsel
   Occupational Safety and Health Review Commission
   1825 K Street, N.W., Suite 601
   Washington, D.C. 20006.

   Any petition filed directly with the Commission will be considered to the extent that time and resources permit. The last day the Commission may consider your petition is September 1, 1982. This final order date is fixed by law and cannot be extended under any circumstances.

3. If review is ordered by a Member of the Commission, each party to this case will be notified. In addition, each party will be given an opportunity to submit a brief to the Commission.

4. Please complete the enclosed postcard indicating whether you presently intend to seek review of this decision and mail the completed card promptly. Your response does not bind you in any way, but it assists the Commission in processing your petition when it is filed.

5. For any further details on the review process, see Commission Rules 90, 91, 92, and 93.

Richard DeBenedetto
RICHARD DeBENEDETTO
Judge, OSHRC

| SECRETARY OF LABOR, | : | |
| Complainant | : | |
| v. | : | OSHRC DOCKET NO. 80-6222 |
| ANDREASSI BROTHERS, INC., | : | |
| Respondent | : | |

Appearances:

Frederick E. Dashiell, Esq., for Complainant

Tanous J. Thomas, Esq., for Respondent

DECISION AND ORDER

On October 2, 1980, respondent, Andreassi Brothers, Inc. (Andreassi), was cited for seriously violating section 5(a)(2)[1/] of the Occupational Safety and Health Act of 1970 (the Act) by failing to comply with the trenching standard 29 C.F.R. §1926.652(c), which, in pertinent part, reads as follows:

> Sides of trenches in hard or compact soil, including embankments, shall be shored or otherwise supported when the trench is more than 5 feet in depth and 8 feet or more in length. In lieu of shoring, the sides of the trench above the 5-foot level may be sloped to preclude collapse, but shall not be steeper than a 1-foot rise to each 1/2 foot horizontal....

1/ Section 5(a)(2) of the Act, 29 U.S.C. §654(a)(2), requires each employer to "comply with occupational safety and health standards promulgated under the Act."

The Secretary proposes that Andreassi be assessed a penalty of $140 for the alleged violation.[2/] Andreassi contested the matter, and a hearing was held on June 23, 1981.

In September 1980, Andreassi was excavating and laying a pipe for a sewer line in Randolph, Massachusetts. During the course of a general inspection on September 15, 1980, OSHA compliance officer John Yanovitch came upon the job site, at which time two of Andreassi's employees were present; one was observed working inside the excavation while the other, the backhoe operator, was standing near the edge of the excavation. The excavation measured 8 feet 5 inches deep, 3 feet wide, and 26 feet long. The backhoe was located in proximity to one end of the excavation (or, more accurately the "trench")[3/] which was sloped; all other sides or walls of the trench were practically vertical. There was no shoring or other support provided for the trench walls. According to the compliance officer, the soil was "fairly hard and compact," and contained some stone and sand (Tr. 45, 53). The compliance officer testified that he saw a failure in the surface of the trench wall which he described as "some sloughing off at the spoils" (Tr. 36-37).

---

2/ Andreassi was also cited for nonserious violations of two other construction safety standards, including the failure to place excavated soil at least 2 feet from the edge of the excavation. Andreassi did not contest the nonserious citation which became a final and nonreviewable order.

3/ 29 C.F.R. §1926.653(n) defines "trench" as:

> A narrow excavation made below the surface of the ground. In general, the depth is greater than the width, but the width of a trench is not greater than 15 feet.

The Secretary contends that the failure to slope or otherwise support the sides of the trench was a serious violation because the condition could have resulted in serious injury or death to the employee who had been working inside the trench (Tr. 63-64).[4/]

Whether the sides of the trench be in "hard or compact soil," as alleged here, or in "unstable or soft material," which apparently is the more appropriate designation in view of the "sloughing" incident viewed by the compliance officer, specific trenching standards require that they be shored, sloped or otherwise supported when the trench is 5 feet or more in depth. In fact, according to Table P-1 of 29 C.F.R. §1926.652, the only kinds of soil which permit a slope of 90 degrees--which is about what existed at the trench being excavated by Andreassi--are solid rock, shale or cemented sand and gravels. The principal hazard of excavation work is death by suffocation or crushing when exposed soil fails and buries a worker. A violation of the trenching safety standard was clearly established in this case by the testimony of the compliance officer and the photographic evidence.

---

4/ Section 17(k) of the Act, 29 U.S.C. §666(k), defines a serious violation:

> A serious violation shall be deemed to exist in a place of employment if there is substantial probability that death or serious physical harm could result from a condition which exists, or from one or more practices, means, methods, operations, or processes which have been adopted or are in use, in such place of employment unless the employer did not, and could not with the exercise of reasonable diligence, know of the presence of the violation.

Substantial probability of an accident is not requisite to the establishment of a serious violation. A serious violation is established if there is a possibility of an accident which, if it occurs, would have a substantial probability of resulting in death or serious physical harm. Secretary v. Portland Stevedoring Co., 1 BNA OSHC 1250, CCH OSHD ¶15,052, No. 5 (July 25, 1973). See also California Stevedore & Ballast Co. v. OSHRC, 517 F.2d 986, 988 (9th Cir. 1975).

Andreassi offered no proof to counter the Secretary's case. Instead, Andreassi relies on the arguments that the excavation job involved only some three hours and the employee worked in the trench only for a part of that time, and that the trench could not have been dangerous inasmuch as the compliance officer did not immediately order the employee out of the trench. The duration of the hazard in this case is relevant to the question of the penalty to be assessed and has no significant bearing on the merits of the citation itself. The validity of a citation rests upon evidence having the quality of proof and fitness to induce conviction. Whether or not a compliance officer, during the course of an inspection, immediately voices a warning on encountering what he believes to be a hazardous condition cannot serve to point out the truth of the matter.

The Secretary having carried his burden of proof, a penalty of $100 is assessed, in accordance with the criteria of 29 U.S.C. §666(j).[5/]

## FINDINGS OF FACT

1. On September 15, 1980, one of Andreassi's employees was working inside a trench measuring 8 feet 5 inches deep, 3 feet wide, and 26 feet long.

2. The soil of the trench was hard and compact and had some stone and sand. The 26-foot-long sides of the trench were essentially vertical and were not shored or otherwise supported.

---

5/ Section 17(j), 29 U.S.C. §666(j), provides:

The Commission shall have authority to assess all civil penalties provided in this section, giving due consideration to the appropriateness of the penalty with respect to the size of the business of the employer being charged, the gravity of the violation, the good faith of the employer, and the history of previous violations.

3. Andreassi's employee was exposed to danger of a cave-in as a result of the absence of shoring or sloping of the sides of the trench.

4. Serious physical harm was substantially probable in the event of a failure of the trench walls, and Andreassi should have known of the violative condition.

## CONCLUSIONS OF LAW

1. At all times relevant herein, Andreassi has been engaged in a business affecting commerce within the meaning of section 3 of the Act, 29 U.S.C. §652 (Tr. 6, 24).

2. Andreassi seriously violated 29 U.S.C. §654(a)(2) by failing to comply with the trenching standard 29 C.F.R. §1926.652(c), and a penalty of $100 is appropriate.

## ORDER

It is ORDERED that the October 2, 1980, citation charging serious violation of 29 C.F.R. §1926.652(c) is affirmed, and a penalty of $100 is assessed.

# NOTICE OF DECISION

Secretary of Labor v. Havens Steel Co.

OSHRC Docket No. 81-2071

1. Enclosed is a copy of my decision. It will be filed with the Commission on August 2, 1982, and will become the final order of the Commission on September 1, 1982, unless a Member of the Commission directs that it be reviewed.

2. You may petition for discretionary review of this decision by the Commission. A petition may be filed directly with me within twenty (20) days from the mailing of my decision. Thereafter, a petition should be mailed to the Executive Secretary, Attention:

   Chief Review Counsel
   Occupational Safety and Health Review Commission
   1825 K Street, N.W., Suite 601
   Washington, D.C. 20006

   Any petition filed directly with the Commission will be considered to the extent that time and resources permit. The last day the Commission may consider your petition is September 1, 1982. This final order date is fixed by law and cannot be extended under any circumstances.

3. If review is ordered by a Member of the Commission, each party to this case will be notified. In addition, each party will be given an opportunity to submit a brief to the Commission.

4. Please complete the enclosed postcard indicating whether you presently intend to seek review of this decision and mail the completed card promptly. Your response does not bind you in any way, but it assists the Commission in processing your petition when it is filed.

5. For any further details on the review process, see Commission Rules 90, 91, 92, and 93.

OSHRC FORM NO. 97

UNITED STATES OF AMERICA

OCCUPATIONAL SAFETY AND HEALTH REVIEW COMMISSION

| | |
|---|---|
| SECRETARY OF LABOR,<br><br>Complainant<br><br>v.<br><br>HAVENS STEEL COMPANY,<br><br>Respondent | OSHRC DOCKET 81-2071 |

APPEARING ON BEHALF OF COMPLAINANT:

JAYLYNN K. FORTNEY, ESQ., U. S. Department of Labor, Office of the Solicitor, 911 Walnut Street, Kansas City, Missouri 64106

APPEARING ON BEHALF OF RESPONDENT:

THOMAS M. MOORE, ESQ., Gould & Moore, Suite 380, 9233 Ward Parkway, Kansas City, Missouri 64114

Hearing held January 19 and March 30, 1982, U. S. Court of Appeals Courtroom, Kansas City, Missouri, Judge Paul E. Dixon presiding.

## STATEMENT OF THE CASE

This is a proceeding pursuant to section 10 of the Occupational Safety and Health Act of 1970, contesting citations issued by the complainant against the respondent under the authority vested in the complainant by section 9(a) of the Act. The citation alleged that an inspection of a workplace under the operation and control of respondent revealed existence of conditions that violated section 5(a)(2) of the Act, for the reason that these conditions failed to comply with certain occupational safety and health standards promulgated by the complainant pursuant to section 6 thereof.

Citation 1 for serious violation, consisting of two items, and proposed penalties in the amounts of $720 respectively for each alleged violation, was issued on August 25, 1981, along with a citation for alleged willful violation, with a proposed penalty of $5,760, which was issued on the same date.

These citations were issued as a result of an inspection conducted on June 17 and 18, 1981, under a warrant following an employee complaint of respondent's worksite, four miles south of Holcomb, Kansas, where respondent was engaged in work as a subcontractor performing steel erection.

Respondent duly contested the citations and the proposed penalties, and upon filing of the complaint and answer by the respondent the cause was at issue.

## CITATIONS

### Citation 1 for Serious Violations
### Item 1

"29 CFR 1926.500(d)(1): Open-sided floors or platforms, 6 feet or more above adjacent floor or ground level, were not guarded by a standard railing or the equivalent on all open sides:

(a) A turbine and/or generator pedestal used as a landing platform, south of the bolt-up deck, approximately 20 feet above concrete floor

on west side and 45 feet above ground on east side, was not equipped with standard railing or equivalent, thus exposing employees to injury."

Item 2

"29 CFR 1926.500(d)(2): Open side(s) of runways, 4 feet or more above floor or ground level, were not guarded by a standard railing, or the equivalent:

(a) A runway on the north side of the pedestal and south side of bolt-up deck, approximately 50 feet above ground level - no standard railing or equivalent was provided, thus exposing employees to injury."

Citation 2 for Willful Violation
Item 1

"29 CFR 1926.500(d)(1): Open-sided floors or platforms, 6 feet or more above adjacent floor or ground level, were not guarded by a standard railing or the equivalent on all open sides:

(a) The south, west, and east sides of the bolt-up deck, approximately 50 feet above ground level, were not provided with a standard railing or the equivalent on all open sides, thus exposing employees to injury."

STANDARDS

"29 CFR 1926.500--Guardrails, Handrails, and Covers
(d) Guarding of open-sided floors, platforms, and runways
(1) Every opensided floor or platform 6 feet or more above adjacent floor or ground level shall be guarded by a standard railing, or the equivalent, as specified in paragraph (f)(i) of this section, on all open sides, except where there is entrance to a ramp, stairway, or fixed ladder. The railing shall be provided with a standard toeboard wherever, beneath the open sides, persons can pass, or there is moving machinery, or there is equipment with which falling materials could create a hazard.
(2) Runways shall be guarded by a standard railing, or the equivalent, as specified in paragraph (f) of this section, on all open

sides, 4 feet or more above floor or ground level. Wherever tools, machine parts, or materials are likely to be used on the runway, a toeboard shall also be provided on each exposed side.
(f) Standard specifications
(1) A standard railing shall consist of top rail, intermediate rail, toeboard, and posts, and shall have a vertical height of approximately 42 inches from upper surface of top rail to floor, platform, runway, or ramp level. The top rail shall be smooth-surfaced throughout the length of the railing. The intermediate rail shall be halfway between the top rail and the floor, platform, runway, or ramp. The ends of the rails shall not overhang the terminal posts except where such overhang does not constitute a projection hazard. Minimum requirements for standard railings under various types of construction are specified in the following paragraphs:"

## THE EVIDENCE

In respondent's answer and at the commencement of the hearing and in its brief, respondent moved for dismissal of complainant's citations on the ground that the citation had been issued 67 days following the inspection, alleging that 1) the delay was unconscionable and 2) the respondent's defense was prejudiced thereby. This issue will be treated later in the Decision.

At the commencement of the proceedings, the parties stipulated that respondent is covered by the Occupational Safety and Health Act of 1970, 29 USC 651, et seq.; the inspection was made on June 17 and 18, 1981, of a location known as the Sunflower Electric Power Plant, which is located a few miles south of Holcomb, Kansas; at the time of the inspection respondent employed 73 employees at the worksite; at one time during the various business activities had employed over 160 employees; at the time of the inspection respondent had employees working at the jobsite; and, further, the citation was issued on August 25, 1981.

The inspection was conducted by compliance officers Robert Lathrop and Homer Groves, who contacted the project manager, Parrish, of United Engineers and then George Wright, respondent's general superintendent, and advised him of the employee complaint.

The wind was high on the 17th, so that the actual and physical inspection was deferred until June 18, 1981.

Lathrop and Groves were conducted to the workareas by Gary Tipton, the job steward.

The inspection started where the boiler steel was being erected to the south side of the turbine generator pedestal where Groves and Tipton climbed a ladder to the top of the turbine pedestal which was some 4 feet wide, 26 feet, 8 inches, long, with some embedded bolts protruding from the surface and which was not equipped with standard railing or the equivalent.

They then traversed a ramp, which was approximately 32 inches wide and 10 feet, 7 inches, long, with its lower portion resting on the pedestal and the upper portion resting on the bolt-up deck. This ramp crossed a 2-foot open gap between the pedestal and the bolt-up deck, which was some 45-50 feet above ground level. (Exhibit GC-3)

The bolt-up deck was described as two bays wide, approximately 150-200 feet long. The deck was a structural part of the power plant which respondent erected. At the time of the inspection, respondent's employees were erecting steel above the bolt-up deck. The bolt-up deck was also utilized to store materials and tools, and was approximately 45-50 feet above ground level.

Groves observed a four or five-man crew on the bolt-up deck working, and interviewed three of them who were involved in installing handrails on an upward stairway near the center of the bolt-up deck.

Groves identified photographs he took (Exhibits GC-1 through GC-5), with Exhibit GC-1 indicating the top ladder from the mid-elevation of the pedestal to the top of the pedestal, which was taken on June 18, 1981. The turbine pedestal with protruding bolts was demonstrated by Exhibit GC-2, with Groves describing the protruding bolts as presenting a tripping hazard to respondent's employees, using the pedestal as an access way to the bolt-up deck. The pedestal was further described as a landing platform to get from the lower elevation to the bolt-up deck. It was Groves' opinion that the lack of handrails on the pedestal presented a fall hazard, which would result in serious injury or death, the distance to the ground being some 20-25 feet on the right side elevation and on the left side some 45-50 feet.

The pedestal was just south of the bolt-up deck and lower by some 3-4 feet.

Groves identified Exhibit GC-3 as the ramp, runway or walkway leading from the turbine pedestal to the bolt-up deck, which also was cited as not being provided with guardrails, and running some 10 1/2 feet long and 32 inches wide, crossing some 2 feet of space from the pedestal to the bolt deck. From the runway on the right to ground level was 45-50 feet on both sides. Groves further perceived a fall hazard involving the ramp, and that death or serious harm would result from such a fall.

Groves identified Exhibit GC-4 as depicting the south portion of the bolt-up deck facing west, and representing approximately 50 percent of the bolt-up deck, and further demonstrating that the bolt-up deck had no perimeter guarding and was some 45-50 feet to ground level. Groves did not at the time of the inspection personally observe the employees at or near the perimeter. Groves identified Exhibit GC-5 as looking up between the steel structures in the concrete pedestal, with the ramp, runway or walkway shown, along with

a plank across a lower elevation.

Groves was advised by respondent's representative Wright that the only other access to the bolt-up area was by use of a skip box and crane. After departing the bolt-up deck and returning to the ground, Groves upon looking upward observed an individual working around the outside edge of a column of the bolt-up deck. Based upon the fact that his descent from the bolt-up deck took approximately five minutes and only respondent's employees were working the bolt-up deck, it was Groves opinion that the individual was one of respondent's employees.

It was Groves' further opinion that the particular employee was exposed to a fall hazard.

Groves then had a closing conference with respondent's representative Wright, wherein he discussed the apparent violations he observed; namely, the unguarded pedestal, the unguarded runway, and the lack of perimeter guarding on the bolt-up deck.

Respondent's Wright claimed that the responsibility for the pedestal rested with the contractor Newburg; further, that respondent's employees would be taken up in a skip box, and agreed to guard the ramp crossing the two structures which was acknowledged to be respondent's equipment.

Wright was quoted as stating that permanent guardrails were being put up, and that the bolt-up deck did not need perimeter guarding.

Compliance officer Robert Lathrop accompanied Groves on the inspection, and concurred generally in Groves' observations. He accompanied Groves for the opening conference with respondent's superintendent at the job trailer, returned the next day with Lathrop proceeding no further than the top of the ladder to the pedestal some 20-25 feet up from the ground from where he could

observe the top of the level. Lathrop observed that there were no guardrails at the pedestal level, nor were there guardrails on the ramp crossing the pedestal to the bolt-up deck. While he did not go to the bolt-up deck, he could see the perimeter and saw no perimeter guarding. It was Lathrop's opinion that the ladder side of the pedestal was some 20-25 feet to concrete, with the other side being some 40-45 feet to ground level, which would also represent the distance of a fall from a ramp; and, that a lack of guarding on the bolt-up deck pedestal and ramp would constitute a serious hazard in that a fall from that height would result in serious injury or death.

Lathrop participated in the closing conference with respondent's superintendent Wright and quoted Wright as stating that if respondent's employees did not go over the pedestal to get to the job they could have been lifted by crane in a skip box.

He further quoted Wright as agreeing to install guardrails on the ramp, but not the bolt-up deck.

Lathrop observed respondent's employees wearing belts and lanyards, but could not determine whether or not they were tied off.

Lathrop was unsure as to when he completed his investigative report for submission to his supervisor, giving estimates ranging from three to four weeks, and did not know when the area director received his report from the supervisor.

Mike Simpson, a former ironworker employee of respondent, testified on behalf of complainant. Simpson has two and-a-half years of college, three years as an apprentice ironworker and was formerly employed as assistant director of safety for the Building Trades Counsel in Wichita, Kansas.

Simpson worked for respondent at the Sunflower Plant, commencing mid-May 1981

until approximately mid-June 1981, for a period of about three and-a-half weeks. Simpson was assigned to a detail crew to erect stairways, handrails and miscellaneous odds and ends.

He worked with a foreman, an apprentice and two other ironworkers.

The first week of employment he worked the bolt-up deck, helping to land and erect stairways that ran up from the deck to the level above.

Simpson observed other respondent employees using the bolt-up deck for access to the toolbox, company equipment, water supply and for break periods.

He described Exhibit GC-3 as demonstrating the southwest section of the bolt-up deck.

The bolts stored on the bolt-up deck were pulled up from the ground by a well pulley and rope, attached at the edge of the deck for supply to the bolters working above.

Simpson described the well pulley as being attached to a column above. The employee would lean over the edge and yell for his needs which would be placed in the bucket and pulled up by the pulley.

Simpson had occasion to utilize the pulley for the acquisition of reamers and a hammer handle.

During his time of employment, Simpson testified that there was never any perimeter guarding around the bolt-up deck, either temporary or permanent, with the only permanent guardrail being around certain stairways.

Simpson identified Exhibit GC-3 as the ramp to the bolt-up deck which was utilized by Simpson as the only access to the bolt-up deck, in that there was no stairway to the elevation.

Simpson observed that respondent's employees use the ramp every day for work on the deck or above.

The only time Simpson observed the skip box being used was to elevate water cans or transport the raising gang to a higher elevation. Simpson also observed buckets of bolts and tool belts being carried by respondent's employees over the ramp which connected the two structures, and noted that the ramp never had any guardrails.

Simpson identified Exhibit GC-2 as the pedestal area, where employees would exit from the ladder, and Exhibit GC-1 as the open area to the ramp and bolt-up deck.

On the right side of the ladder, it was Simpson's estimate that there was a 20-foot drop, and on the left a drop of approximately 45 feet.

Simpson never observed any guardrails on the pedestal.

Simpson complained about the unguarded conditions to his job steward, Gary Tipton, and foreman, Shonaway, about a week before he contacted OSHA.

He made a complaint to OSHA on June 10, 1981, and signed the complaint on June 11, 1981.

In describing the use of respondent's skip box, Simpson testified that the skip box was utilized to transport persons to the bolt-up deck or other levels first thing in the morning, occasionally before lunch and right after lunch, and right before quitting time to transport equipment, men and water cans back to the ground.

Normally, the crane would be erecting steel during the day, and employees would utilize the ladder, pedestal and ramp to obtain access to the bolt-up deck.

With respect to the well pulley, it was Simpson's testimony that he had observed both the bolt-up forman and apprentice going to the perimeter to utilize the well pulley to receive material, namely bolts, and that he himself

had used the pulley on one or two occasions.

Never at any time had he observed any cable strung at the well pulley.

Simpson described the toolbox on the bolt-up deck as being approximately 2 1/2 feet high by 6 feet long by 2 1/2-3 feet deep, where along with tools there was stored on the bolt-up deck bolts, materials and water.

The toolbox was located some 5-10 feet from the edge of the deck and some 25-30 feet from the well pulley on the northeast face of the structure.

The water was close to the center, near the stairwell.

The bolts were stored near the toolbox about 10 feet from the perimeter.

Simpson described two skip boxes as being available at the jobsite to reach the upper levels, but noted that the skip boxes were not requested if the crane was in use.

At the time Simpson was at the jobsite, there was no iron work to be performed on the pedestal, but rather the pedestal was utilized as an area to walk to the bolt-up deck.

From the ladder to the top of the pedestal, the employees would walk across the pedestal approximately 12 feet or so to the ramp, which went up at a 45-degree angle onto the bolt deck operation. It was Simpson's estimate that the distance between the two structures was approximately 3 feet, with about a 2 1/2-3 foot rise.

It was Simpson's estimate that the crossing ramp was approximately 3 feet across and without guardrails. The ramp was equipped with cleats made up of strips of wood to keep the employees' feet from sliding. He estimated the ramp to be roughly 5-6 feet long with a drop of 40 feet at that point.

Simpson never observed any of respondent's employees performing work from the ramp, although he observed them utilizing the ramp to travel to the

bolt deck or elevations above or travelling down to the ground.

Simpson's work crew, besides the foreman and apprentice, consisted of one Bill Fassnichi, Charles Lamore and Bill Martin. Fassnichi is an apprentice in Simpson's local in Wichita, Kansas. Lamore was from a local in Colorado and Martin was from a local in Utica, New York.

The only guardrail Simpson observed during his 3 1/2 weeks employment was the last day he worked on the job before voluntarily terminating when he observed his crew working on handrails for a stairway cater-cornered from the area, but he did not recall any permanent guardrail being put in, although there was a considerable amount of guardrail on the ground.

He never observed any wire rope cables strung along part of the expanse of the north edge of the bolt deck or at the perimeter where the wheel well pulley was situated to raise bolts to the deck.

Simpson, in addition to observing his foreman Shonaway and the bolt-up foreman using the ramp access to the bolt-up deck, also observed a foreman who is responsible for the tank crew using the ramp to reach the bolt deck, along with members of his own crew and other of respondent's employees.

It was Simpson's testimony that on any given day at least two-thirds or three-fourths of respondent's employees working at elevation would utilize the pedestal ramp to achieve access to the bolt-up deck, which would amount to approximately 12-15 workers.

These trips were required for personal functions, in that the toilet facility was on the ground and workmen would be transferred from one duty to another during the course of the work.

Gary Tipton, an ironworker, employed by respondent February 23, 1981, and on the jobsite June 16 and 17, 1981, testified on behalf of complainant.

As union steward, Tipton accompanied Lathrop and Groves on their June 18 inspection.

Mike Simpson had complained to him some three weeks before with safety complaints on two or three occasions. Simpson discussed perimeter rails and safety nets, but Tipton did not recall the pedestal being mentioned.

Tipton was requested by Simpson to talk to respondent's representative, which he had already done. Tipton testified that he had talked to superintendent Wright regarding temporary handrails on the stairs.

Tipton talked to Wright about perimeter guarding on the bolt-up deck, quoting Wright as responding, "...as long as we were installing permanent handrails, there was no need for temporary ones."

At the time of the discussion no one was actually installing permanent rails on the perimeter of the bolt deck, although there were rails being installed elsewhere, in that two decks were being used from time to time, the other deck being the one below the bolt deck. Tipton could not say for sure whether or not there were any permanent handrails other than that around the stairwell on the bolt deck. He acknowledged that Exhibit GC-4 demonstrated no guardrail at the west end of the bolt deck, nor had there ever been to his knowledge.

On the date of the inspection June 18, 1981, there were respondent's employees working on the bolt-up deck. Tipton also testified that the employees would have had to come down to the bolt-up deck to get materials or water, and if tools were stored there to obtain tools.

Tipton described the course of the inspection party as up a two-sided ladder to the top of the pedestal, which he described as being used by most of the employees to reach the bolt deck, adding that he thought there was one other ladder but it was not used.

Tipton identified Exhibit GC-2 as being the top of the pedestal that was crossed and utilized by respondent's employees to reach the bolt deck. It was Tipton's recollection that there had been guardrails attached to the pedestal, but he did not recall why or when they were taken down.

Tipton identified Exhibit GC-3 as being the ramp or "chicken ladder" utilized to cross from the pedestal to the bolt deck, and testified that he used the ramp and had seen respondent's employees using it.

Tipton never saw any handrails prior to the inspection on the "chicken ladder".

Tipton had observed job superintendent Wright on the bolt-up deck level, along with two foremen, John Coffey and Bob Shonaway.

It was Tipton's recollection that following the inspection, while at ground level, his attention was called to what he believed to be the level above the bolt-up deck where he saw a man swing around a column, but Tipton was not convinced it occurred on the bolt-up deck.

In response to a question from the compliance officer, Tipton responded that he did not recall if he gave the compliance officer the employee's name or just identified him as one of respondent's employees.

Tipton has been an ironworker on and off for 25 years. However, as union steward he performed no tool work, but rather took up the complaints of the men to the management and tried to have the complaints rectified. It was Tipton's recollection that at the peak of the job there were probably 80 ironworkers at the site, and it was his belief that the job would have taken about 1,000 man-hours in construction. In his capacity as union steward, he was not aware of any injuries other than of a minor nature. To his knowledge, there were no broken bones or loss of fingers or any falls.

There had been several safety complaints on the job which had been rectified to Tipton's satisfaction, with the only disagreement being over the guardrails as to whether to put up temporary guardrails while permanent ones were being installed on any of the decked perimeters such as the bolt deck.

Tipton described work from the bolt deck as consisting of bolts being distributed to different locations, a toolbox site and employees taking their breaks on the deck.

The bolts were kept in buckets probably 10 feet from the north edge in two piles, which were pulled up on a wheel well pulley on the north side of the bolt-up deck at the edge.

It was Tipton's belief that at the time of the inspection respondent had one cable stretched from the column to the diagonal brace or to the next column, the idea being that when the apprentice pulled bolts up he was supposed to lean onto the cable if he was going to lean over the edge, but Tipton could not say how much cable was up or how long it was up. If the apprentice did not pull up the bolts other people would come from other elevations to raise bolts, which would be taken out onto the beams as the bolting up process was taking place at the time.

Tipton estimated the bolt deck to be approximately 50 by 200 feet, with its decking having been placed. After the decking is down, the bolt-up has to be done around the edge.

Tipton guessed that the decking had been down probably three weeks.

It was Tipton's recollection that contractor Newburg had guardrails on the perimeter of the pedestal, which were taken down immediately after the pour.

The guardrails were reinstalled within a few days after the compliance

officers' inspection.

There was no work for respondent's employees on the pedestal, except to traverse to the bolt-up deck or the higher elevations.

Tipton described the use of skip boxes by the connectors to achieve elevations that were too long of a climb as the main reason, the climb being 200 feet.

Respondent had regular safety meetings every couple weeks and Monday morning once-a-week meetings conducted by the foremen, where safety items and complaints were entertained.

It was Tipton's recollection that at the time he saw the employee swing around the outside of the column there was a diagonal to the inside of the column; he further observed two other employees which he believed had a piece of handrail that he thought they were going to slip to the first employee on the perimeter.

Tipton described that when the expanded metal grating or decking is installed a guardrail can be put up at that point as normal procedure, the grating constituting a completed floor.

Tipton testified that individuals would ride the skip boxes at noon and break time, but not all the time because iron was being hung with the rig. The box was utilized in the morning, at break time, at noon, prior to noon, afternoon break, and in the evening.

Respondent's personnel manager, David Hinkley, along with his other duties is also charged with respondent's safety program.

He testified that it is respondent's policy to install either temporary or permanent guardrails when an employee is going to work at or near an edge of a building, but that on this particular job they already had permanent

guardrails available and respondent decided to install the permanent guardrails rather than have a double installation with putting in temporary guardrails.

He testified that generally if the other trades are going to work in the area they will not take down the guardrails themselves. Either the respondent removes the temporary guardrails or the trades that follow behind or other contractors will remove it.

With respect to the jobsite in question, Hinkley had received a call from the superintendent Wright with respect to putting up the perimeter guarding.

Hinkley testified that he had advised Wright that they were going to put up permanent guardrails, and he saw no need for temporary guardrails. It was Hinkley's advice to Wright that they were not going to have anybody at the edge and there was no use in sending someone to the edge and exposing them to the risk of falling in order to put up a temporary guardrail.

Hinkley established the departure date of ironworker Lamore as July 3, 1981, Fassnichi July 8, 1981, Martin July 23, 1981, and Simpson June 18, 1981.

He further testified that it was a 106,000 man-hour job, with one man falling from a boom with no injury.

Hinkley attempted to contact ironworkers Lamore and Fassnichi after the citation, but the respondent's information available on the men was very limited and his efforts were fruitless.

Respondent's field superintendent George Wright testified on behalf of respondent. His previous work experience was that of a working foreman with 17 years in construction as an ironworker.

Wright was superintendent June 17 and 18, 1981, at the jobsite, and was the individual presented with the inspection warrant by the compliance officers on June 17.

At this point, he advised the compliance officers that most of the employees were off the site due to high wind conditions.

Wright accompanied the inspectors to the pedestal structure where one of the compliance officers pointed out the ramp running between the pedestal structure and the bolt deck, at which time he advised the compliance officer that he was not aware the ramp was there; nor was he aware that the ramp was being used as access to the bolt deck, as he had been advised by the general foreman that the skip box had been tied up approximately one hour every morning getting everybody to the worksite.

The complaints were explained to Wright regarding the perimeter guardrails, to which Wright responded that at the time they were being installed.

With regard to the bolt-up deck, it was Wright's testimony that the only work going on the deck was some work on the stairway that went from the deck upwards, which is located in the central portion of the bolt deck.

Bolts were being stockpiled in the area at the east end of the bolt deck in the northeast corner. There is also a stockpile of bolts in the middle of the deck in the middle of the east and west towards the north side.

Wright testified that he had not been on the deck at the time they were stockpiling, but told foreman Coffey to keep the stockpile at least 10 or 15 feet away from the edge.

Wright estimated the dimensions of the bolt deck to be two bays, approximately 50 feet wide or approximately 150-200 feet long.

Respondent erected the steel and placed the deck. Upper steel erection was still going on.

Wright located the wheel well pulley as being to the east of the center line to the bolt deck with another one located towards the east side, with

both of them being on the north edge of the bolt-up deck, the one closer to the center and the other further to the east.

Wright testified that there was approximately 1/2-inch cable strung between columns three and five at the one well pulley, or from column five to a diagonal brace where the bolts would be pulled up. His observation of this was made from the ground prior to the inspection. Wright did not know how long the cable had been there, having relied on his bolt-up foreman.

Wright denied knowledge that the pedestal was being utilized by means of access prior to the inspection, basing his reliance on reports he was getting from his general foreman that it was taking so much time to get the employees onto the workareas in the skip boxes.

Wright recalled that at one time there were guardrails around the entire top perimeter and center section of the pedestal when they were pouring concrete.

Respondent had no work to do in the area of the pedestal.

Wright had no recollections when the guardrails were taken down, but estimated that it was after the first week in June in that the pedestal was poured May 15.

Wright felt that the guardrails were taken down because material was being landed on the pedestal by Newburg.

Newburg replaced the guardrails following the inspection within a period of five days.

Wright described safety meetings as being held by the foremen, probably every two weeks on a Monday before commencing work.

It was Wright's testimony that he had never been on the bolt deck prior to the inspection from February to June, because the deck did not go up until close to the last week in May.

He knew of the stockpile bolts on the deck from his observations from the ground.

Wright further guessed that permanent decking on the bolt deck had been down at the very most a couple of weeks.

The deck below the bolt deck had been guardrailed, and the permanent guardrail for the bolt deck was on the job.

Wright was aware that two weeks prior to the inspection respondent's employees were doing work on the bolt deck, and that there was no perimeter guarding.

Wright was aware that the employees were obtaining tools from a toolbox 10-15 feet away from the edge and storing stockpiles of bolts some 10-15 feet from the edge.

Wright recalled safety steward Tipton contacting him, but did not recall the matter discussed, although he recalled the gist of a part of the conversation was that an employee complained about putting up some temporary guardrails of some kind.

Wright testified that steel cable was used as perimeter guarding and was available on the job and could be put up in about an hour in the correct fashion.

The second well pulley at the perimeter did not have a wire cable, because due to Wright there was no way to put a cable at the pulley.

Wright conceded that the apprentice or the bolt-up foreman used the pulley, but denied that it was hanging over the edge, but rather testified that there was a grated walkway where the employees could stand on and pull the load to a higher elevation with the grating located in the interior of the building and about 7 feet wide down the edge of the building, so that the person who

was to get the supplies would get them from the pulley and take them to the other side.

Wright testified that he knew there were no guardrails on the pedestal prior to the inspection, but he did not know there was a ladder going up to the top of the pedestal; nor had he ever seen the ramp crossing over to the bolt-up deck from the pedestal.

## DISCUSSION

### Issue of 67-Day Delay in Issuance of Citation

Respondent strenuously argues that its case was prejudiced by its inability to locate three members of the crew working with Simpson; one, an apprentice out of Simpson's local in Wichita, Kansas, one from a local in Colorado, and one employee from a local in Utica, New York.

In a recent decision by a divided Commission, the majority in the case, which involved the passage of 177 days from the date of the alleged violations until the issuance of citation, reiterated the general principles to sucessfully carry this defense. (See Stripe-A-Zone v. OSHRC and Secretary of Labor, __F.2d__ (5th Cir., 1981), OSHRC Docket 79-2380, 80 OSHRC 11/C14, 80 OSHRC 111/D12, 9 BNA OSHC 1040, CCH OSHD ¶24,029, 24,912)

The employer must establish prejudice in the preparation or presentation of its defense, and the appropriate consideration for determining whether to vacate a citation for the complainant's noncompliance with section 9(a) of the Act is the prejudice to the employer from the delay rather than the justifiability of the delay (cases cited).

This Writer can find no material harm rendered respondent by virtue of the delayed citation.

There was no showing by respondent of the insufficient knowledge of the

details of the citation that would be peculiar within the knowledge of the absent witnesses, in that 1) all of the violations were in plain view from either ground level or from atop the pedestal, in particular the crossing ramp could be observed from the ground, along with the ladder to the pedestal and the well pulley; 2) superintendent Wright was fully advised at the commencement of the inspection and at the close of the inspection of the employee complaint and the nature of the alleged violations; 3) the representations of respondent as to what, if anything, the absent members of the crew would contribute to the evidence is all of a speculative nature and without foundation in contrast to the physical evidence photographed and the eye witness testimony of the participants in the inspection and the employees who were particularly concerned with the absence of guarding in and around the workarea; 4) the argument by respondent that guardrails had been removed from the pedestal prior to its use by respondent's employees and foremen as a means of access is not relevant to the case law involved in this case; namely, the Grossman/Anning-Johnson, infra., defenses where the principle inquiry is whether or not the respondent has used all reasonable efforts to forestall use rather than tolerate use of a hazardous access route as a means of arriving to the job location; 5) respondent stated intentions of not providing temporary guardrails to the bolt-up deck; 6) superintendent Wright's admission to the compliance offiter that the cross ramp was respondent's equipment, so that; 6) the evidence as to when the ramp was installed or built was irrelevant to the case law of its use by respondent's employees and foremen.

Further, there is no major discrepancy in the testimony of the locations of items and activities taken place on the bolt-up deck, but to the contrary there is general accord in the use of the cited facilities throughout the testimony.

Based upon the foregoing, respondent's motion is denied on the basis that it did not suffer prejudice in the delayed issuance of the citation.

Citation 1: Alleged Serious Violations of 29 CFR 1926.500(d)(1) and 29 CFR 1926.500(d)(2)

The genesis of liability on a multi-employer jobsite was established by the case of Secretary v. Anning-Johnson Co., OSHRC Docket 3694/4409, 76 OSHRC 54/A2, 4 BNA OSHC 1193, CCH OSHD ¶17,817, 20,690, where it was held that the complainant must show a violation of the standard and employee exposure or access to a hazard.

It further held that the employer had a defense that did not create or control the violative condition, nor had the means to rectify the violative condition.

Further, that if the subcontractor neither created nor controlled the violative condition it could show that its employees, if exposed, were protected by realistic measures as an alternative or it did not have, nor with the exercise of reasonable diligence could have, notice of a condition being hazardous.

Where the subcontractor neither created nor controlled the hazardous condition, he had the duty, if its employees were exposed, to do what is "realistic" under the standard.

As was stated in a recent decision by the 10th Circuit, U. S. Court of Appeals in Dun-Par Engineered Form Co. v. Ray V. Marshall & OSHRC, __F.2d__ (10th Cir., 1982):

> "However, Dun-Par's attempt to recharacterize the situation does not undermine the Commission's finding that the company participated in the erection of the open-sided floor while leaving its edges unguarded. The creation of the hazard resulted in this case not from Dun-Par's actions, but from a lack thereof."

Along with the Anning-Johnson case, supra., it was established by Secretary v. Grossman Steel and Aluminum Corp., OSHRC Docket 12775, 76 OSHRC 54/D9, 4 BNA OSHC 1185, CCH OSHD ¶19,982, 20,691, that each employer is responsible not to create hazards to any employees. The general contractor is liable if it could reasonably have expected to prevent or abate the hazard. The subcontractor is not liable who could not reasonably detect the violation, or abate it if it discovered a violation, even though its employees were exposed. Further, the employer must exert efforts to have the hazard abated, and the employer has the burden of proof of showing its steps taken to abate, which can be asserted as an affirmative defense.

It is felt, in the present case, that the respondent has failed to demonstrate any one of the required elements established by the cases cited.

With respect to the exposure of respondent's employees and foremen to the hazard, the tests have been enunciated in Peter J. Brennan v. Gilles & Cotting & OSHRC, 504 F.2d 1255 (4th Cir., 1974), OSHRC Docket 504, 73 OSHRC 44/E13, 76 OSHRC 30/D9, 1 BNA 1388, 3 BNA 2002, CCH OSHD ¶15,140, 16,763, 18,861, 20,448 (remand case), where a showing of actual exposure to hazard is not necessary to establish the violation, in that the complainant could prove exposure under what was described as a practical test of "reasonable predictability" of access to a hazard and what was described in a separate opinion as a test of "reasonable anticipation" of the risk of employees from the hazard. It was further stated that such acts could be established by showing:

> "...that employees either while in the course of their assigned working duties, their personal comfort activities while on the job, or their normal means of ingress-egress to their assigned workplaces, will be, are, or have been in a zone of danger."

Thus, the utilization of the means of access by ladder to pedestal by ramp to bolt-up deck by respondent's foremen and a substantial number of its employees is verified both by the testimony of Tipton and Simpson and has satisfied the requirements of exposure to a fall ranging from 25-45 feet to either concrete or ground level, which could result in severe bodily injury or death. (See Thermo Tech, Inc. v. U. S. OSHRC, 580 F.2d 1051 (5th Cir., 1978), OSHRC Docket 15381, 77 OSHRC 192/A2, 5 BNA OSHC 2045, CCH OSHD ¶20,697, 22,281)

A finding is made of the testimony of respondent's superintendent, as to his lack of knowledge or awareness of the ramp being used as an access to the bolt-up deck and as to a cable being strung at one of the well pulleys and his lack of knowledge of employees using a ladder to the pedestal to gain access to the bolt-up deck, to be totally and entirely incredible.

His self-contradictory testimony that from the ground he could observe strung cable across pulley prior to the inspection and that he could observe storage of bolts on the bolt-up deck is entirely inconsistent with his inability to observe the crossing ramp in open view, which could be observed from the ground, and the access ladder to the pedestal which was also equally in open view.

The complainant has met and carried his burden of proof as to the three cited violations, and respondent was in serious violation of citation 1, items 1 and 2, and citation 2 for willful violation of 29 CFR 1926.500(d)(1).

## Citation 2: Alleged Willful Violation of 29 CFR 1926.500(d)(1)

Complainant introduced Exhibit GC-6, quoting a 29 CFR 1926.500(d)(1) alleged serious violation by respondent of open-sided floor, based upon an inspection made February 13, 1974, at a workplace at 1101 Walnut Street, Kansas

City, Missouri, along with Exhibit GC-7, citation for nonserious violation by respondent of 29 CFR 1926.500(b)(1), based upon 25 feet of unguarded open-sided floor at the third floor level from an inspection on February 7, 1974, of a worksite at 18815 East 39th, Independence, Missouri.

The Review Commission's definition to what constitutes a willful violation, as stated in Secretary v. Titanium Metals Corp. of America, OSHRC Docket 14080, 80 OSHRC 6/A2, 7 BNA OSHC 2173, CCH OSHD ¶24,198 (Petition denied 1980, 3rd Circuit), states:

> "...the Commission has followed a test that regardless of venal motive, willfulness is established by a conscious, intentional, deliberate decision and may be characterized by a careless disregard of the requirements of the Act or an indifference to employee safety."

Here the respondent made a conscious and deliberate decision not to comply with a known requirement of the Act in not providing interim guardrail protection in three areas, namely the pedestal, the ramp and finally the bolt-up deck. The Commission's definition has been adopted in the Eighth Circuit by Western Waterproofing Co., Inc. v. Marshall & OSHRC, 576 F.2d 139 (8th Cir., 1978), p. 143, wherein the Court stated:

> "Western's officials substituted their own judgment for the provisions of the standards and therefore cannot escape the conclusion that they acted voluntarily with either intentional disregard of, or plain indifference to, the requirements of the Act. The regulations allow no such unbridled discretion."

The respondent was in willful violation of 29 CFR 1926.500(d)(1), in that the record is replete with the testimony of its job superintendent and its personnel manager with responsibilities for its safety program, of a deliberate decision not to install temporary guardrails.

## PENALTY

A review of the cases involving affirmances of willful violation indicates the principal guideline to be applied.

> "In respect to Occupational Safety and Health Act provision penalizing an employer who willfully violates the safety requirements of the Act, Congress intended to punish the conduct of one who 'intentionally disregards the statute or is plainly indifferent to its requirements'." [Intercounty Construction Co. v. OSHRC, 522 F.2d 777, p. 778 (4th Cir., 1975)]

The penalties heretofore assessed indicate Western Waterproofing Co., Inc. v. Marshall & OSHRC, supra., $9,000; Intercounty Construction Co. v. OSHRC, supra., $5,000; Cedar Construction Co. v. OSHRC and F. Ray Marshall, 587 F.2d 1303 (1978), $9,500 reduced to $4,050; National Steel & Shipbuilding Co. v. OSHRC, 607 F.2d 311 (9th Cir., 1979), $2,000; Georgia Electric Co. v. F. Ray Marshall & OSHRC, 595 F.2d 309, $6,500 and $650 respectively for the willful and serious citation.

The evidence disclosed that the respondent's construction involved some 106,000 man-hours at the jobsite, with no employee falling or having been seriously injured, and it is felt that this should operate as a mitigating circumstance in light of the foregoing cases and also serve the stated principle to act as a deterrent and to punish respondent for a deliberate violation of the guarding standard, therefore it is felt that a penalty of $5,760 is appropriate for citation 2, willful violation, along with a penalty of $720 for each of the serious violations.

## FINDINGS OF FACT

Based upon the preponderance of the credible evidence, the following findings of fact are made:

1. Respondent is a corporation which, on June 17 and June 18, 1981, maintained a construction jobsite at a project which was some four miles south of Holcomb, Kansas, where it was engaged in steel erection.

2. Respondent maintains its principal office and place of business in Kansas City, Missouri.

3. Respondent is engaged in the business of structural steel erection, which is a business affecting commerce as the term is defined in the Act.

4. As a result of the inspection made on June 17 and June 18, 1981, respondent was issued citations for violation of three provisions of the Act, consisting of one citation for serious violation, with two items, and one citation for willful violation, pursuant to section 9(a) of the Act.

5. The citations and proposed penalties were issued on August 25, 1981, with respondent filing its notice of contest August 27, 1981.

6. Respondent employed 73 persons at the Sunflower Electric Plant worksite and approximately 160 employees in its various business activities.

7. The inspection was precipitated by employee Simpson's complaint of unguarded floors and an unguarded pedestal utilized as access to the bolt-up deck.

8. Compliance officers Lathrop and Groves obtained a warrant respecting the areas to be inspected, and under the warrant were accompanied by job steward Tipton, where they observed a ladder used to gain access to a top of a turbine pedestal, which had a ramp connected from it to the bolt-up deck, where respondent had a crew of some four or five men working installing handrail around an interior stairway.

9. The pedestal was 4 feet wide, 28 feet, 8 inches, long, with cemented bolts protruding from the surface.

10. On the right side of the pedestal the distance to ground level was 20-25

feet, and on the left-hand side was a distance of 45-50 feet to ground level.

11. At the time of the inspection, the pedestal was not equipped with standard railing or the equivalent and had not been so equipped for a period of approximately three and-a-half weeks prior to the inspection.

12. The ramp crossing from the pedestal to the bolt-up deck was approximately 32 inches wide and 10 feet, 7 inches, long, and crossed a 2-foot open gap between the pedestal and the bolt-up deck which was some 45-50 feet from ground level, and at the time of the inspection and for approximately three and-a-half weeks preceding had no standard railing or the equivalent attached to it.

13. The bolt-up deck was two bays wide, approximately 150-200 feet long and a structural part of the power plant.

14. At the time of the inspection, respondent's employees were erecting steel above the bolt-up deck.

15. The bolt-up deck was used to store materials and tools, and was approximately 45-50 feet above ground level and was not guarded by standard railing or its equivalent.

16. The ladder, unguarded pedestal, ramp and bolt-up deck were utilized by a substantial number of respondent's employees and its foremen to gain access to the bolt-up deck in the normal pursuit of their duties.

17. There existed the falling hazard of a distance of 20-50 feet from either the pedestal, ramp or bolt-up deck.

18. Work activities took place at the edge of the bolt-up deck, consisting of the utilization of two well pulleys for the transfer of tools and bolts for stockpiling for the steel erection.

19. The employees Tipton and Simpson had complained previous to the inspection to their foremen and superintendent about the unguarded conditions of the

pedestal, ramp and bolt-up deck.

20. Respondent's management made a deliberate decision not to provide interim guarding on the pedestal ramp or bolt-up deck.

21. Respondent utilized no alternative means of guarding for the pedestal, ramp or bolt-up deck. Respondent's foremen established that a cable could have been strung around the perimeter of the bolt-up deck in approximately an hour's time.

22. Respondent's supervisory personnel, who were on the jobsite and during the course of time preceding the inspection of approximately three and-a-half weeks, were aware of the lack of perimeter guarding.

## CONCLUSIONS OF LAW

1. Respondent is an employer within the meaning of the Act.

2. Jurisdiction over the parties in the subject matter herein is conferred upon the Occupational Safety and Health Review Commission by section 10(c) of the Act, and the citations were issued in accordance with section 9(a) of the Act.

3. Respondent committed a serious violation of section 5(a)(2) of the Act by failing to comply with the Occupational Safety and Health Act of 1970, as alleged in citation 1 and complaint as being in serious violation of 29 CFR 1926.500(d)(1) and 29 CFR 1926.500(d)(2) and in willful violation as alleged in citation 2, item 1, of 29 CFR 1926.500(d)(1).

## DECISION AND ORDER

Based upon the above findings of fact and conclusions of law, it is hereby ORDERED:

1. Citation 1, items 1 and 2, for alleged serious violations of 29 CFR 1926.500 (d)(1) and 29 CFR 1926.500(d)(2), is affirmed, and a penalty of $720 for each

violation respectively is hereby assessed, for a total of $1,440.

2. Citation 2 for alleged willful violation of 29 CFR 1926.500(d)(1) is affirmed, and a penalty of $5,760 is hereby assessed.

DATE: August 2, 1982

1100 Commerce Street
Dallas, Texas 75242

NOTICE OF DECISION

Secretary of Labor v. Electro Painters, Inc.
OSHRC Docket No. 81-2093

1. Enclosed is a copy of my decision. It will be filed with the Commission on August 2, 1982, and will become the final order of the Commission on September 1, 1982, unless a Member of the Commission directs that it be reviewed.

2. You may petition for discretionary review of this decision by the Commission. A petition may be filed directly with me within twenty (20) days from the mailing of my decision. Thereafter, a petition should be mailed to the Executive Secretary, Attention:

   Chief Review Counsel
   Occupational Safety and Health Review Commission
   1825 K Street, N.W., Suite 601
   Washington, D.C. 20006.

   Any petition filed directly with the Commission will be considered to the extent that time and resources permit. The last day the Commission may consider your petition is September 1, 1982. This final order date is fixed by law and cannot be extended under any circumstances.

3. If review is ordered by a Member of the Commission, each party to this case will be notified. In addition, each party will be given an opportunity to submit a brief to the Commission.

4. Please complete the enclosed postcard indicating whether you presently intend to seek review of this decision and mail the completed card promptly. Your response does not bind you in any way, but it assists the Commission in processing your petition when it is filed.

5. For any further details on the review process, see Commission Rules 90, 91, 92, and 93.

Louis G. LaVecchia
Judge, OSHRC

DECISION AND ORDER

Appearances:

Donald W. Hill, Esquire, for the Complainant.

D. Allen Grumbine, Esquire, for the Respondent.

This is a proceeding under section 10(c) of the Occupational Safety and Health Act of 1970. The respondent was cited for several alleged violations of the safety standards promulgated under the Act. It did not contest Item 1a of Citation No. 1, nor Item 1 of Citation No. 2. Those have become final orders by operation of law. The remaining items (other than 1a of Citation No. 1) are contested.

A hearing in the matter was held on April 27, 1982 at Dallas, Texas.

The respondent stipulated to the jurisdiction of the Commission in this proceeding, and to its engagement in a business affecting commerce within the meaning of applicable sections of the Act. (Answer, pp. 1,2).

The alleged violations, as set forth in Citation No. 1, and characterized as "serious," are described as follows:

Item

1b 29 CFR 1910.107(c)(6): Electrical wiring and equipment not subject to deposits of combustible residues but located within spraying area(s) was not of the explosion-proof type approved for Class I, Group D, locations conforming to the provisions of Class I, Division I, hazardous locations:

a. Paint Shaker, no S/N, Spraying Area.
b. Exhaust window fan, no S/N, Spraying Area-North Wall.
c. Two (2) each off/on switches to lights - Spraying Area - East Wall.
d. Sixteen (16) each Colorant Machine operating on 110 volt circuit, Spraying Area.
e. Electrostatic Hand Spraying Machine, no S/N, Spraying Area.

1c 29 CFR 1910.107(c)(7): Electric lamps outside of but within 20 feet of spraying area(s), and not separated therefrom by partition(s), were not totally enclosed to prevent the falling of hot particles:

Six (6) each Fluorescent Lamps, Spraying Area.

1d 29 CFR 1910.107(e)(2): The quantity of flammable or combustible liquids kept in the vicinity of spraying operations exceeded the minimum required for operation:

Approximately 150 gallons of paint and catalyst including two (2) 55-gallon drums of cleaning solvent, Spraying Area.

1e 29 CFR 1910.107(i)(6): Electrically conductive objects in the electrostatic hand spraying area(s) were not adequately grounded:

Metal paint containers and wash cans.

An unallocated penalty of $280 was proposed for the alleged violation of all items included in Citation No. 1.

The Relevant Testimony

The government compliance officer stated that he performed an inspection of the respondent's warehouse in Dallas on July 16 and 17, 1981. An employee complaint had mentioned the possibility of hazardous fumes being present in the workplace, and also the presence of possible electrical shock hazards. (Tr. 5). No spraying operations were being done at the time of the inspection, the employees having been assigned duties in the field. (Tr. 5,6).

The area where spraying operations were performed was a room about 25 feet long, 20 feet wide, and perhaps 10 feet high. An exhaust fan was located on one wall and there was an overhead metal door. (Tr. 7,8). The inspector noted, upon nearing the employer's office area, an odor of some kind and a burning sensation in his eyes. He felt a little dizzy. (Tr. 8). He experienced the same sensations in the spraying area. There was a portable, hand-held, electrostatic spraying unit plugged into a 110-volt outlet in the spray room. (Tr. 9). The pilot light on a hot water heater (gas) was lighted, as was a gas pilot light on an air conditioning unit. (Tr. 9). The other conditions described in the citation were also noted. (Tr. 9).

Using a Scott's Vapor Tester, the inspector tested containers of paint, catalyst, and cleaning solvent that were used in the spraying operations. (Tr. 10). Substantial quantities of these materials were found in the spray room. (Tr. 15).

On cross-examination the witness stated that he had a college degree in Business Administration, but no background in chemistry or electrical engineering. (Tr. 19). He was told by respondent's representatives that very little spray painting was done at the warehouse and that the bulk of respondent's painting was done in other places. (Tr. 24). He considered combustion possible only when the lower explosive limit in a concentration of vapors was reached. (Tr. 27). Since there was no spraying operation underway at the time of the inspection the compliance officer could not test the atmosphere to determine whether combustible quantities of vapors were present. (Tr. 28). No such testing was conducted at any time during the inspector's visit. (Tr. 28). The only testing performed was done at six-inch heights over open containers of paint, etc., with the Scott tester. (Tr. 29). No testing of residues or deposits or dust was done, and very little residue was noted. (Tr. 31). Upon examining his inspection notes the witness stated that the paint reading reached 18 percent of the lower flammable level; the catalyst reached 40 percent of the lower flammable limits; and the cleaning solvent measured 10 percent of the lower flammable explosive limit. (Tr.33).

The witness stated that he was only testing the materials used in the spraying operations for their combustibility. (Tr. 33). He was not able to say whether the vapors from the materials would reach the lower flammable limits under actual working conditions. (Tr. 33). Without reaching the lower flammable limits, combustion could not occur. (Tr. 35). Even assuming the presence of vapors which were within the limits of combustibility, there must be present a source of ignition in order to cause an explosion. (Tr. 48, 50).

The respondent's president testified that its business in the main comprises the electrostatic painting or coating of primarily metal office furniture. The vast majority of the work is performed at the customers' locations. The company has been in business about 25 years, has about 20 branches throughout the Umited States, and does some business in Canada. (Tr. 53,54). The equipment used is not the conventional spray gun mode. There is no overspray; the electrostatic system used can be kept within the confines necessary to do the job. (Tr. 55). (Ex.R-1). (Ex. R-2). The system is automatically grounded into the building's electrical modes when the work is performed. (Tr. 61). The items to be coated are also grounded individually with proper wires provided by the respondent for that purpose. (Tr. 61). Metal paint cans are normally not within the area when the painting is being done. At the warehouse, once the paint is mixed it is put in sealed pots and becomes part of a grounded unit. (Tr. 61).

The company has never had a fire or explosion or accident of that nature in its 25-year history, and has not been previously cited by OSHA. (Tr. 62).

Respondent's manager of technical services, with 20 years' experience in the field of electrostatic coatings, stated that in formulating coatings to be used in its processes the safety factor is given a very high priority. Consequently, certain properties which might be superior in durability, etc., are sacrificed in order to attain a safer product. (Tr. 68). Calculations based on the typical jobs performed at the Dallas warehouse indicated that combustible materials in the atmosphere would be about .019 percent by volume. This figure translates to less than 2 percent of the lower combustible limit. Accordingly, it would take 50 times that amount to arrive at the lower combustible limit. (Tr. 71-74). An industrial hygienist, Carol Lane, was engaged to perform testing during actual operations at the warehouse. At no time did the readings reach more than 5 percent of the lower explosive level. The fan was off and the door closed at the time of the testing, with measuring instruments only two feet from the piece being painted. (Tr. 75). This was an effort to present the worst-case condition, since normally the door is opened to about six inches and the exhaust fan is operating. (Tr. 76). Two percent was obtained at two feet; at three feet the reading was 1.9 or less; and at six feet from the object being painted no readings were attainable for lack of detection of combustible vapors. (Tr. 76). The readings of two to five percent translate to two to five percent of one percent of combustible vapors in the atmosphere. (Tr. 77). The meters used for testing had been calibrated. (Tr. 81). (Ex. R-3).

An expert in the field of electrostatic processes explained the manner in which the "Ransburgh gun" is used in the electrostatic coating of objects. (Tr. 120-123). The gun, when properly used, is incapable of releasing enough engery to ignite the most flammable mixture of any paint solvent. The process results in an infinitesimal amount of overspray. Use of the types of solvents utilized by the respondent in conjunction with the Ransburgh gun creates no hazard of explosion. (Tr. 131). Tests have been conducted to measure the energy release by the Ransburgh gun, and they have been negative insofar as ignition hazards are concerned. (Tr. 131). None of the readings testified to by the compliance officer constituted a combustible mixture. (Tr. 132). From his knowledge of the warehouse respondent uses for electrostatic coating of some objects, and considering the equipment used and the manner in which the paint is applied, the witness could see no danger in the operations. (Tr. 140).

## Discussion

Only the respondent filed a brief of law and argument. It argues, essentially, that the cited operations do not fall within the definition of "a spraying area" as defined in 29 CFR 1910.107(a)(2),i.e., "any area in which dangerous quantities of flammable vapors or mist, or combustible residues, dust or deposits are present due to the operating of the spraying processes." It points out that dangerous quantities of flammable vapors or mist can exist only where the concentration of vapors or mist reaches the lower explosive limit of the material involved. Hydronamics, Inc., 7 OSHC 2019 (1979). The extent of the testing done by the compliance

officer was the holding of test instruments about 6 inches above open cans of solvent, catalyst and paint to determine vapor concentrations. Even under this obviously unsatisfactory method of determining whether dangerous mixtures of the materials were in the atmosphere, the lower explosive limit of the solvents was not reached. The readings were, in fact, far below the lower explosive limits of the materials. No actual spraying operations were being performed at the time of the inspection, reflecting adversely upon the weight of the evidence in any event.

The simulated operations conducted by the respondent for test purposes and the presentation of its case bear out its contentions, in the absence of any evidence to the contrary, that no hazard is presented in the spray painting by electrostatic gun of objects in the warehouse used for that purpose. In these circumstances, Items 1b through 1e of Citation No. 1 will be, and hereby are, VACATED.

So ORDERED.

Louis G. LaVecchia

## NOTICE OF DECISION

Secretary of Labor v. International Bridge Corporation
OSHRC Docket No. 80-3748

1. Enclosed is a copy of my decision. It will be filed with the Commission on August 4, 1982, and will become the final order of the Commission on September 3, 1982, unless a Member of the Commission directs that it be reviewed.

2. You may petition for discretionary review of this decision by the Commission. A petition may be filed directly with me within twenty (20) days from the mailing of my decision. Thereafter, a petition should be mailed to the Executive Secretary, Attention:

   Chief Review Counsel
   Occupational Safety and Health Review Commission
   1825 K Street, N.W., Suite 601
   Washington, D.C. 20006.

   Any petition filed directly with the Commission will be considered to the extent that time and resources permit. The last day the Commission may consider your petition is September 3, 1982. This final order date is fixed by law and cannot be extended under any circumstances.

3. If review is ordered by a Member of the Commission, each party to this case will be notified. In addition, each party will be given an opportunity to submit a brief to the Commission.

4. Please complete the enclosed postcard indicating whether you presently intend to seek review of this decision and mail the completed card promptly. Your response does not bind you in any way, but it assists the Commission in processing your petition when it is filed.

5. For any further details on the review process, see Commission Rules 90, 91, 92, and 93.

| SECRETARY OF LABOR, | : | |
| Complainant, | : | |
| v. | : | OSHRC Docket No. 80-3748 |
| INTERNATIONAL BRIDGE CORPORATION, a Corporation, | : | |
| Respondent. | : | |

## DECISION

A citation was issued by the complainant (Secretary) on June 6, 1980, charging the respondent International Bridge Corporation (International) with three serious violations of OSHA safety regulations. The citation relates to conditions observed during a routine OSHA inspection on May 28-30, 1980, at a bridge construction worksite near Hazelcrest, Illinois.

The hearing in this case was begun in Chicago, December 17, 1980. After several continuances, the presentation of evidence was ultimately completed September 29, 1981. The last brief was filed December 3, 1981. The Secretary was represented in these proceedings by attorney Leonard Borden of the office of the Solicitor, Department of Labor, Chicago. International was represented by attorneys John M. Vander Aa and James Lanting, of the firm Vander Aa and Lanting, South Holland, Illinois.

## Eye Protection

Item 1 of the citation alleges a failure to use required eye protective equipment. The citation states:

> Employees were not protected from potential eye injury by the use of eye or face protection or other appropriate personal protective equipment:
>
> Protective equipment was not used to protect employees from eye injury when chipping concrete with air hammers. Location: East bound lane of route 294 at Ashland Avenue.

The regulations alleged to have been violated are 29 C.F.R. 1926.28(a) and 1926.102(a)(1). Section 1926.28(a) reads as follows:

> The employer is responsible for requiring the wearing of appropriate personal protective equipment in all operations where there is an exposure to hazardous conditions or where this part indicates the need for using such equipment to reduce the hazards to the employees.

Section 1926.102(a)(1) is as follows:

> Employees shall be provided with eye and face protection equipment when machines or operations present potential eye or face injury from physical, chemical, or radiation agents.

The evidence conclusively established that several of International's employees were using jackhammers to strip concrete and blacktop from the surface of a bridge. They wore no safety goggles or other equipment to protect their eyes from the danger of flying fragments.

The OSHA compliance officer testified that while on the inspection tour,

> "I observed approximately seven employees chipping asphalt and concrete from the surface of the road with air hammers without the protection of eyeglasses, eye goggles or face shields. . . " (T 49)

With reference to the hazard presented, the compliance officer testified:

> "Well, chipping concrete with an air hammer, chips are flying around. Some of the employees were facing one another and a piece of concrete could be embedded in an employee's eye. He could lose his eyesight or have severe eye injury, even severe facial damage." (T 50)

International argues that its obligations under the regulations were fulfilled in that Rule No. 4 of its Company Safety Rules (Exh.5) specifically requires the wearing of eye and face protection where there is danger from flying objects or particles. International further points out that appropriate eye and face protection was provided by the company and was available at the jobsite.

The Commission has ruled that more is required of a company than promulgating a personal protection regulation and furnishing the equipment. Bechtel Poser Co., 7 OSHC 1361 (1979). The employer must also show that the safety rule was effectively communicated to the employees, and was enforced. A. J. Mc Nulty & Co., 4 OSHC 1097 (1976); Candler-Rusche, Inc., 4 OSHC 1232 (1976); Jensen Construction Co., 7 OSHC 1477 (1979); R. Zoppo Co., Inc., 9 OSHC 1392 (1981).

International's sole method of communicating the safety workrule to the employees was the furnishing each of them with the safety booklet. (T 158)

No procedure for enforcement of safety rules had been set up or implemented. (T 131) Respondent's safety director testified that it was not until after the date of the inspection that supervisors were instructed to carry out a system of progressive disciplinary action to enforce the safety rules. (T 164, 166)

The safety policies of the International in force at the time of the citation were patently inadequate. Rules unenforced are soon rules dis-disdained. By failing to adequately communicate safety requirements to employees, and by not enforcing them, International failed to fulfill its obligation under the Act to insure safe working conditions.

A violation of Sec. 1926.28(a) has been duly established. Therefore, arguments of International relating to the alternative allegation of a violation of Sec. 1926.102(a)(1) need not be addressed.

Fall Protection

Item 2 of the citation charges that personal protective equipment was not used by employees who were working more than 25 feet above the ground. The citation alleges:

> Employee(s) were not protected against falls of more than 25 feet by the use of safety nets, ladders, scaffolds, catch platforms, temporary floors, safety lines, safety belts, or other appropriate personal protective equipment:
>
> Fall protection equipment was not used where it was necessary by reason of hazards encountered in a manner capable of causing serious injury or impairment in the function of any part of the body. Location: Three employees placing concrete in stem from 32 feet above the ground. Employee directing concrete breaker on south side of bridge 50 to 60 feet above ground and road.

The regulations that the government claims were violated are 29 C.F.R. 1926.28(a), (quoted supra), 29 C.F.R. 1926.104(a) and 1926.105(a). Sec. 1926.104(a) reads as follows:

> Lifelines, safety belts, and lanyards shall be used only for employee safeguarding. Any lifeline, safety belt, or lanyard actually subjected to inservice loading, as distinguished from static load testing, shall be immediately removed from service and shall not be used again for employee safeguarding.

Sec. 1926.105(a) states:

> Safety nets shall be provided when workplaces are more than 25 feet above the ground or water surface, or other surfaces where the use of ladders, scaffolds, catch platforms, temporary floors, safety lines, or safety belts is impractical.

The OSHA inspector testified that he observed three of International's employees working on a pier or column 32 feet above the ground. They were pouring concrete into a metal form (called a stem form) that had been erected. (T 54) They did not have safety belts. There was a single guard rail on one side of the work platform. The other three sides were unprotected.

In a separate instance, the inspector observed an employee standing on a parapet wall 40 to 60 feet above ground level, giving directions to the operator of a chipping machine that was in the process of demolishing a portion of the parapet wall. (T 57) The inspector testified that the employee, although standing at the edge of the wall, had no type of fall protection. Photos entered in evidence quite graphically support this testimony (Exhs. 5, 8).

International contends that the single guardrail on the one side of the work platform atop the stem form was adequate to protect the workers, since that was the only side where employees worked. However, even if that were a valid defense, the photograph Exhibit 5 negates the assertion that employees stayed exclusively on the one side. It shows one employee working on the extreme edge of an unprotected side.

With reference to the worker on the parapet wall, the respondent conceded a violation occurred, but attributed it to idiosyncratic employee misbehavior in violation of company safety policy. However, the defense of employee misbehavior is not available to an employer that does not enforce safety policy. In Asplundh Tree Expert Co., the Commission said that to support such a defense,

> "The employer must show that it established work rules designed to prevent the violation adequately communicated these rules to its employees, took steps to discover if violations of these rules occurred, and effectively enforced the rules when violations were discovered." 6 OSHC 1951, 1953 (1978)

Because International failed to show that it qualified to assert the affirmative defense of employee misconduct, such defense fails.

The evidence has satisfactorily established that both violations occurred as charged in Item 2 of the citation. The same will therefore be affirmed as violations of 29 C.F.R. 1926.28(a).

## Ladder

Item 3 of the Citation alleges a failure to provide a suitable ladder for access to the top of the stem form. The citation states:

> Ladder(s) were not used to give safe access to all elevations:
>
> Employees were exposed to falling 32 feet to ground level when using horizontal bracing as steps for access to top of form. Fall capable of causing serious injury or fatality.

The regulation governing the use of ladders is 29 C.F.R. 1926.450(a)(1):

> Except where either permanent or temporary stairways or suitable ramps or runways are provided, ladders described in this subpart shall be used to give safe access to all elevations.

It is undisputed that no ladder was provided for access to the work platform atop the stem form. Workers reached the platform by climbing the stem form's vertical side, using "stiffeners" as rungs. (T 198) Stiffeners are horizontal iron slats, used to brace the form, spaced twelve inches apart from the bottom to the top of the stem form. (T 198)

International suggests this item be vacated for the reason that these stiffeners made the stem form the "substantial equivalent" of a fixed verticle ladder.

In order to qualify as a fixed ladder, or substantial equivalent, a ladder must meet the requirements of Sec. 1926.450(a)(5). The stem form falls far short of these requirements. Among other things, there are no side rails or prescribed safety devices that a fixed verticle ladder must have under that regulation. (T 85, 95, 96, 97)

No ladder as required by section 1926.450(a)(1) having been provided by the respondent, citation Item 3 must be affirmed.

The evidence and the record as a whole, support the following findings of fact:

## FINDINGS OF FACT

1. Respondent, International Bridge Corporation, is a corporation having a place of business at 7015 West 5th Avenue, Gary, Indiana, and a workplace or near Hazelcrest, Illinois where it engaged in concrete bridge construction, general contracting and related activities.

2. Jurisdiction is not contested by respondent.

3. Several of respondent's employees were using jackhammers to strip concrete and blacktop from the surface of a bridge; none of them wore safety goggles or other equipment to protect their eyes from flying fragments.

4. Three of respondent's employees were working on a stem form 32 feet above the ground without safety belts; a single guard rail had been erected on one side of the platform; the other three sides were without guardrails.

5. An employee of respondent was standing on a parapet wall 40 to 60 feet above ground level without any fall protection.

6. Respondent did not provide a ladder for access to a 32 foot high work platform atop a stem form; workers reached the platform by climbing the stem form's vertical side, using horizontal iron slats, 12 inches apart, as rungs; the iron slats or stiffeners had no side rails or other safety devices and was not a fixed ladder as defined by regulation.

7. Respondent's Safety Rule No. 4 requires the wearing of eye and face protection when there is danger from flying objects or particles; respondent's sole method of communicating its safety rules to employees was by furnishing each a copy of the safety booklet.

8. No procedure for enforcement of safety rules was set up or implemented until after issuance of the instant citation.

9. The penalties proposed herein are excessive under the facts and circumstances; penalties of $180.00 for Item 1, of $320.00 for Item 2, and of $60.00 for Item 3 are appropriate.

From the above findings, the following conclusions of law are reached:

## CONCLUSIONS OF LAW

1. Respondent was at all times material and employer engaged in a business affecting commerce within the meaning of Section 3(5) of the Occupational Safety and Health Act.

2. Respondent was at all times subject to the requirements of the Act and the standards promulgated thereunder.

3. The commission has jurisdiction of the parties and the subject matter of this proceeding.

4. As to Item 1 of the citation, respondent violated provisions of 29 C.F.R. 1926.28(a) for which a penalty of $180.00 should be imposed.

5. As to Item 2 of the citation, respondent violated provisions of 29 C.F.R. 1926.28(a) for which a penalty of $320.00 should be imposed.

6. As to Item 3 of the citation, respondent violated provisions of 29 C.F.R. 1926.450(a)(1) for which a penalty of $60.00 should be imposed.

7. Respondent's method of communicating its safety rules to workers and its method of enforcing compliance with safety rules were inadequate.

8. The iron slats used as rungs by workers to reach the top of a stem form do not meet the prescribed specifications for a verticle fixed ladder.

## ORDER

Based upon the foregoing findings of fact and conclusions of law, it is now ORDERED that:

1. Item 1 is affirmed as a serious violation, and a penalty of $180.00 is imposed.

2. Item 2 is affirmed as a serious violation, and a penalty of $320.00 is imposed.

3. Item 3 is affirmed as a serious violation, and a penalty of $60.00 is imposed.

## NOTICE OF DECISION

Secretary of Labor v. **John R. Hughes Construction Corporation**
OSHRC Docket NO. **80-4354**

1. Enclosed is a copy of my decision. It will be filed with the Commission on **August 5, 1982**, and will become the final order of the Commission on **September 7, 1982**, unless a Member of the Commission directs that it be reviewed.

2. You may petition for discretionary review of this decision by the Commission. A petition may be filed directly with me within twenty (20) days from the mailing of my decision. Thereafter, a petition should be mailed to the Executive Secretary, Attention:

   Chief Review Counsel
   Occupational Safety and Health Review Commission
   1825 K Street, N.W., Suite 601
   Washington, D. C. 20006.

   Any petition filed directly with the Commission will be considered to the extent that time and resources permit. The last day the Commission may consider your petition is **September 7, 1982**. This final order date is fixed by law and cannot be extended under any circumstances.

3. If review is ordered by a Member of the Commission, each party to this case will be notified. In addition, each party will be given an opportunity to submit a brief to the Commission.

4. Please complete the enclosed portcard indicating whether you presently intend to seek review of this decision and mail the completed card promptly. Your response does not bind you in any way, but it assists the Commission in processing your petition when it is filed.

5. For any further details on the review process, see Commission Rules 90, 91, 92 and 93.

JUDGE'S DECISION
AUG 5 '82
RECEIVED
FINAL ORDER ON
SEP 7 '82

DECISION AND ORDER

Appearances:

E. Justin Pennington, Esq., of Dallas, Texas, for the Complainant.

Scott R. Kidd, Esq., of Austin, Texas, for the Respondent.

BOTKIN, Judge:

This is a proceeding brought before the Occupational Safety and Health Review Commission ("the Commission") pursuant to §10 of the Occupational Safety and Health Act of 1970, 29 U.S.C. 651 et seq. ("the Act"), contesting citations issued by the complainant, the Secretary of Labor ("the Secretary"), to the respondent, John R. Hughes Construction Corporation ("Hughes Corp."), under authority vested in the Secretary by §9(a) of the Act.

As a result of an inspection conducted on June 26, 1980, of a workplace located at Loop 1 North at Hart Lane, Austin, Texas, where respondent's employees were engaged in work activities necessary to install a 48-inch water main beneath Loop 1, three citations were issued to respondent on July 11, 1980, alleging violations of §5(a)(1) and §5(a)(2) of the Act. The citations charged

respondent with (i) a serious violation of §5(a)(1) of the Act, (ii) a willful serious violation of §5(a)(2) of the Act, and (iii) a repeat nonserious violation of §5(a)(2) of the Act. A total penalty of $5,120.00 was sought.

Respondent timely filed notice of contest on July 23, 1980, commencing this proceeding before the Commission under §10(c) of the Act. Thereafter, a complaint and answer were filed with the Commission. A hearing was held in this matter on March 18, 1981, in Austin, Texas. No affected employees or representatives of affected employees participated in the proceeding. Complainant submitted a post-hearing brief and respondent submitted proposed findings of fact and a post-hearing brief. The matter is now ripe for decision.

## JURISDICTION

In its answer, respondent admitted that jurisdiction of the proceeding was conferred on the Commission by §10(c) of the Act. It denied that it is an employer engaged in a business affecting commerce who has employees within the meaning of §3(5) of the Act. However, at the hearing, respondent stipulated that it is an employer within the meaning of §3(5) of the Act (Tr. 5). I so find. Therefore, no issue remains in regard to jurisdiction.

## ISSUES

1. Whether respondent was in repeat nonserious violation of 29 CFR 1926.450 (a)(2), and, if so, the appropriate penalty therefor.

2. Whether respondent was in serious violation of §5(a)(1) of the Act, and, if so, the appropriate penalty therefor.

3. Whether respondent was in willful serious violation of 29 CFR 1926.652(c), and, if so, the appropriate penalty therefor.

## PARTIAL RESOLUTION OF THE FACTS

On June 26, 1980, Roy E. Moore ("CO Moore") and Walter B. Cunningham ("CO Cunningham"), compliance officers with the Occupational Safety and Health Administration ("OSHA") conducted an inspection of respondent's workplace located at Loop 1 North at Hart Lane in Austin, Texas (Tr. 12, 14-15, 116-117). Respondent's employees were engaged in work activities related to the installation of a water main beneath Loop 1, pursuant to a contract between respondent and the city of Austin (Tr. 13, 17-18, 167-168).

CO Moore, a safety engineer, has been employed by OSHA since June 1975 (Tr. 7-8, 11-12). He holds a B.S. degree in electrical engineering (Tr. 9-10, 96). He has over 25 years of combined experience in the fields of manufacturing engineering and manufacturing engineering management, including the care and maintenance of manufacturing facilities and oversight of the construction of new manufacturing facilities (Tr. 8). Manufacturing engineering involves consultation with design engineers regarding the choice of machinery and processes. Manufacturing engineering management is an extension thereof. One of the primary considerations of both jobs concerns the design features of machinery which is manufactured as it relates to job safety (Tr. 9). Although he had some involvement in excavation of basements for several houses in Illinois, his personal work experience in the construction business as it relates to excavation had been primarily with OSHA. He has never been an engineer on the commercial construction of underground utilities such as utility water and waste water (Tr. 97). He has attended various training courses since becoming employed by OSHA, including a two week course at Oklahoma University in soil mechanics and soil safety (Tr. 10-11, 97). The course consisted of both lecture

and laboratory experience. The course dealt with (i) the nature of soils, (ii) soil behavior under various conditions, (iii) the load bearing capacity of soils, (iv) the freestanding capacity of soils, (v) the kinds of forces generated by soils and what can happen as a result thereof, and (vi) the effect of water on soils (Tr. 11, 97).

CO Cunningham, a safety engineer, has been employed by OSHA for approximately four years (Tr. 111-112). He holds a B.S. degree, together with approximately 40 additional hours in engineering subjects. He is a registered professional engineer in the field of safety and a certified safety professional (Tr. 115). His qualifications in the fields of industry (safeguarding of industrial equipment and machinery) and vertical transportation (elevator safety) enabled him to become a licensed professional safety engineer in the state of California (Tr. 115-116). During his employment with OSHA, he has conducted approximately 450 inspections with one-third of them involving construction activities (Tr. 112). On a reverse chronological basis, his prior work experience included the ownership and operation of a safety consulting firm, for an approximate eight year period, where he provided such service to businesses (insurance companies, small contractors and other small businesses) which did not have their own safety departments (Tr. 112). In such work, he conducted simulated OSHA inspections (Tr. 113). Other periods of employment were spent with (i) several insurance companies as a safety engineer, (ii) Westinghouse Electric, and (iii) the U.S. Corps of Engineers (Tr. 113-114). The latter, a 19-month stint, included duties with a construction battalion involving a miscellany of construction activities, such as (i) constructing airport landing areas and barracks, (ii) paving roads, (iii) building trenches, and (iv) installing water and sewer lines (Tr. 114). His

total work experience in safety related occupations exceeds 20 years (Tr. 114-115). Special training courses which he has taken since joining OSHA include a soil safety course at Oklahoma University and a course in underground tunnels at the Ampshire Academy in West Virginia (Tr. 115).

John R. Hughes, Sr. ("Hughes"), is president of the respondent and John R. Hughes, Jr. ("Hughes, Jr."), his son, is vice-president thereof (Tr. 13-14, 118-119, 164-165). Hughes, his wife and son own the respondent corporation. He started this business approximately 15 years ago (Tr. 165). However, he has been involved in this type of work for 25 years, commencing as a laborer and ultimately becoming the owner of the subject firm (Tr. 204-205). He has laid three to five million feet of pipe in trenching operations in the Austin area (Tr. 205). He manages the respondent on a daily basis, bidding and pursuing jobs (Tr. 165). Until three or four months prior to the hearing, he oversaw the daily affairs (work activities) of respondent (Tr. 165-166). It is his practice to regularly visit worksites in order to keep informed of work progress and work conditions at each worksite (Tr. 166). He was completely familiar with "every inch" of the subject worksite prior to and on June 26, 1980 (Tr. 166-167).

After arrival at respondent's worksite during the morning of June 26, 1980, CO Moore presented his credentials to the foreman, Lee Davis ("Davis"). Shortly thereafter, Hughes, Jr., arrived and again CO Moore presented his credentials. They accompanied CO Moore throughout most of the inspection (Tr. 13-15). During the afternoon portion of the inspection, CO Cunningham came to the worksite to assist CO Moore in the inspection process (taking measurements and photographs)(Tr. 15, 116-118).

Davis was at the worksite on a regular basis, but not at all times. Hughes stopped by the worksite two or three times a day, but it was not determined how often Hughes, Jr. was there (Tr. 51, 93).

29 CFR 1926.450(a)(2)- Ladder Issue

Item 1 of repeat nonserious citation 3 alleges that, on or about the date of the inspection, a violation of 29 CFR 1926.450(a)(2) occurred as follows:

> 29 CFR 1926.450(a)(2): Defective ladder(s) were in use by employee(s):
>
> Ladder in trench east of Loop 1 southbound lanes had bent siderails and 5 damaged rungs.

The cited standard provides:

> §1926.450 Ladders.
>
> (a) General requirements.
>
> * * *
>
> (2) The use of ladders with broken or missing rungs or steps, broken or split side rails, or other faulty or defective construction is prohibited. When ladders with such defects are discovered, they shall be immediately withdrawn from service. Inspection of metal ladders shall include checking for corrosion of interiors of open end hollow rungs.

Many of the underlying facts related to this citation are not in dispute. On the date that respondent was inspected, there was an aluminum ladder in the trench located on the west side of the lanes for southbound traffic on Loop 1 North ("trench A")(Tr. 86-88, Ex. P-2).[1] It was a 24-foot extension ladder, with each section 12 feet long (Tr. 86). The rungs were made of aluminum tubing (Tr. 90). The ladder was resting on the bottom of the trench and

---

1 Exhibits P-9k and P-10 are photographs of the ladder (Tr. 87-89).

against the east wall thereof (Tr. 87). The boring machine was also in trench "A" (Tr. 89, Ex. P-9k). Since the ladder was not extended, the ladder rungs of each section were parallel to and even with one another (Tr. 220-221). The side rails of the ladder were bent and there were also damaged rungs (Tr. 87).[2] The ladder rungs are approximately one foot apart (Tr. 96). One photograph was taken at an angle which does not reveal the damage to the ladder (Tr. 88, Ex P-10). In the other photograph, damage to the ladder can be seen (Tr. 89, Ex. P-9k). The bottom rung of the ladder was submerged in water. (Tr. 96).[3] Commencing at the surface of the water shown in the trench, the photograph reveals obvious damage to the first, third and fourth rungs above the water level (Tr. 89, Ex. P-9k). Those damaged rungs were approximately two, four and five feet above the bottom of the trench, respectively. The other two damaged rungs were near the top of the ladder (Tr. 96).[4] The damaged rungs near the bottom of the ladder exhibited a definite bowing or bending downward in the center portions thereof (Tr. 87-90, Ex. P-9k). Instead of being straight, the side rails of the ladder exhibit a definite bowing to the right (Tr. 90, Ex. P-9k). CO Moore did not observe this ladder being used by a workman during the inspection (Tr. 91). It was impossible to ascertain whether the damage to the ladder was old or new (Tr. 109).

---

2 Hughes admitted that the ladder was damaged (Tr. 221).

3 Nevertheless, that rung can be seen in Ex. P-9k.

4 My eye is unable to detect damage to the rungs near the top of the ladder in Ex. P-9k. This is probably due to camera angle. There is no reason to doubt CO Moore's testimony on this point (Tr. 87-89). Moreover, it went unchallenged by respondent.

This standard is designed to protect workers from falls caused by damaged or defective ladders.[5] The standard applies to the cited condition and the terms of the standard have not been met. Therefore, the existence of the hazard has been established.[6] Nevertheless, in its brief, respondent contends the evidence does not establish that the ladder was used in a damaged condition and, consequently, there is a failure of proof that a violation occurred. In effect, respondent argues that employee exposure to the cited condition was not proven. Respondent correctly points out that CO Moore (i) did not observe the ladder being used, and (ii) did not know how long the ladder had been in the trench (Tr. 91, 104-105). In fact, he could not tell whether the damage to the ladder was new or old (Tr. 107-109). However, his unrebutted testimony shows that (i) the boring machine was also in the same section of the trench as the ladder, (ii) a worker identified himself as the operator of the boring machine, (iii) Davis, the foreman, stated that the ladder was used by the boring machine

---

5 I agree with CO Moore's interpretation of the standard (Tr. 91-92).

6 See Pratt & Whitney Aircraft, 81 OSAHRC 39/A2, 9 BNA OSHC 1653, 1981 CCH OSHD ¶25,359(No. 13401, 1981), appeal withdrawn, No. 81-4104(2nd Cir. August 3, 1981), and cases cited therein for a discussion of this type of standard where a hazard is presumed. In so finding, I have not overlooked the testimony by Hughes that, since it was not extended, he assumed it was as strong as an undamaged ladder which was extended. However, at the same time, he admitted that he did not know how much residual strength the damaged ladder contained (Tr. 221). Moreover, this standard does not speak in terms of equivalence. I agree with CO Moore that (i) the structural integrity of the ladder had been substantially compromised by the damage thereto, and (ii) there was a possibility of the ladder failing and collapsing under the weight of a worker (Tr. 92). Despite the effect of a double rung, a person ordinarily places his foot on the leading edge of the rung in front. Finally, Ex. P-9k appears to reveal that the side rails in both sections exhibit a bow to the right.

operator to gain access thereto, (iv) there was no other available means of access to the bottom of the trench, and (v) Davis told him that the boring machine had not been in use for several days (Tr. 89, 91, 109).[7] As a result of the foregoing, CO Moore was of the opinion that the damaged ladder had been used to enter and leave the trench, but not for several days prior to the inspection (Tr. 91, 109).[8] The Commission had recently reaffirmed its previous holdings that, in addition to direct evidence, circumstantial and hearsay evidence are admissible in these proceedings and such evidence may be probative. Ultimate Distribution Systems, Inc., 82 OSAHRC ____, 1982 CCH OSHD ¶26,011 (No. 79-1269, April 15, 1982).[9] I find that said unrebutted testimony by CO Moore has probative value. I further find that the physical facts, coupled with the admissions (by Davis and the operator of the boring machine), support a reasonable inference that, several days prior to the inspection, the damaged

---

7 The Secretary unsuccessfully attempted to present Mr. Davis as a witness (Tr. 192-193).

8 He admitted that (i) this was an opinion, and (ii) it was not impossible that a worker had used the ladder on the day of the inspection. However, it is clear that his opinion was based on circumstantial evidence and admissions (Tr. 91, 109-110).

9 However, CO Moore's testimony regarding what he was told by Davis and the operator of the boring machine is not hearsay. It constitutes an admission by a party-opponent. See Rule 801(d)(2)(D) of the Federal Rules of Evidence.

ladder was used by the operator of the boring machine.[10] By the same token, the circumstantial evidence and admissions, together with reasonable inferences arising therefrom, support a finding that there was employee access to the cited condition. See Daniel Construction Company, 82 OSAHRC , 1982 CCH OSHD ¶26,027 (No. 16265, April 20, 1982) and cases cited therein.

The Secretary has the burden of proving employer knowledge of nonserious violations of the Act. Prestressed Systems, Inc., 81 OSAHRC 43/D5, 9 BNA OSHC 1864, 1981 CCH OSHD ¶25,358 (No. 16147, 1981). Therefore, the record must establish that the respondent knew or, with the exercise of reasonable diligence, could have known of the violation. The evidence establishes that (i) Davis was on the site on a regular basis, (ii) Hughes visited the worksite two or three times a day, and (iii) CO Moore presented his credentials to Davis after arrival at the worksite on the date of the inspection (Tr. 13-15, 51, 93).[11] The violative condition was readily discoverable by sight if either of them had exercised reasonable diligence. Therefore, the requisite knowledge was present. It is well established that a supervisor's knowledge is imputable to an employer.

---

10 In arriving at this finding, I have carefully weighed testimony by Hughes that (i) he buys approximately ten ladders a month, and (ii) he gets rid of damaged ladders as soon as he finds them (Tr. 221). However, these statements do not refute the above findings. He made no statement as to the frequency or regularity of inspections for damage to ladders. In fact, respondent offered no evidence that would establish the damaged ladder was not used until the day of the inspection. Moreover, other evidence establishes that this is not a novel situation with respondent (Exs. P-7 and P-8).

11 CO Moore's testimony is uncontraverted.

Wander Iron Works, 80 OSAHRC 40/A2, 8 BNA OSHC 1354, 1980 CCH OSHD ¶24,457 (No. 76-3105, 1980). I find that the violative condition did bear a direct and immediate relationship to employee safety and health. Therefore, a nonserious violation was established.

The next issue is whether the violation was repeated within the meaning of §17(a) of the Act. The evidence of record establishes that, at the time of the current violation, there was a Commission final order against the respondent for a violation of the same standard due to a defective ladder in use in a trench. The inspection took place in October 1978 and a citation was issued during the same month. Subsequently, respondent withdrew its notice of contest as part of a settlement agreement which was approved in March 1979 (Tr. 93-95, Exs. P-7 and P-8).

In its brief, respondent points out that the prior citation (October 1978) involved a different ladder (Tr. 104). It also contends that one previous unrelated citation does not establish a repeat violation, citing Bethelehem Steel v. O.S.H.R.C. ("Bethlehem"), 540 F.2d 157(3d Cir. 1976). In limine, it should be observed that I am constrained to follow Commission precedent. In Potlatch Corp. ("Potlatch"), 79 OSAHRC 6/A2, 7 BNA OSHC 1061, 1979 CCH OSHD ¶23,294 (No. 16183, 1979), the Commission rejected the "more than twice" concept favored by the Third Circuit in Bethlehem. In Potlatch, the Commission held that (i) a violation is repeated if at the time of the alleged repeated violation, there was a Commission final order against the same respondent for a substantially similar violation, (ii) a prima facie case of substantial similarity can be established by showing

that the past and present violations are for failure to comply with the same standard, and (iii) a respondent may rebut the prima facie case by establishing that the factual circumstances of the violations are so dissimilar that they cannot be viewed as substantially similar. I find that the Secretary has established a prima facie case. The fact that different ladders were involved in the two situations does not serve as a rebuttal thereof. Accordingly, I find that a repeat violation has been proven.

In light of the record and the statutory penalty criteria set forth in §17(j) of the Act, I conclude that a penalty of $125.00 is reasonable and appropriate.

## FINDINGS OF FACT

The evidence of record having been considered and evaluated in its entirety, the following facts are specifically found:

1. To avoid repetition, those facts set forth (i) under the headings entitled JURISDICTION and PARTIAL RESOLUTION OF THE FACTS, and (ii) those undisputed facts set forth in the third paragraph of the foregoing discussion of item 1 of repeat nonserious citation 3 (immediately following a recital of the standard), are hereby incorporated by reference to the extent that they are not set forth hereunder.

2. On June 26, 1980, an inspection was conducted by compliance officers of OSHA of a workplace located at Loop 1 North at Hart Lane in Austin, Texas, where respondent's employees were engaged in work activities related to the installation of a water main beneath Loop 1, pursuant to a contract between respondent and the city of Austin.

3. On the date that respondent was inspected, there was an aluminum ladder in the trench located on the west side of the lanes for southbound traffic on Loop 1 North.

4. It was a 24-foot extension ladder, with each section 12 feet long.

5. The rungs of the ladder were made of aluminum tubing.

6. The ladder was resting on the bottom of the trench and against the east wall thereof. A boring machine was in the same trench.

7. Since the ladder was not extended, the ladder rungs of each section were parallel to and even with one another.

8. The ladder rungs were approximately one foot apart. The bottom rung of the ladder was submerged in water.

9. There were five damaged rungs, two near the top of the ladder and, the first, third and fourth rungs above the water level at the bottom of the trench. Those near the bottom of the trench exhibited a definite bowing or bending downward in the center portions thereof.

10. The side rails exhibited a definite bowing to the right.

11. It was not possible to ascertain whether the damage to the ladder was new or old.

12. Circumstantial evidence and admissions by respondent's foreman and operator of the boring machine, together with reasonable inferences arising therefrom, establish that (i) several days prior to the inspection, the damaged ladder was used by the operator of the boring machine, and (ii) there was employee access to the cited condition.

13. The operator of the boring machine was not protected from a fall hazard related to the use of the ladder when the structural integrity thereof had been substantially compromised by damage thereto.

14. Respondent's supervisors knew or, with the exercise of reasonable diligence, could have known of the hazard described in finding no. 13 hereof which was created by the work conditions heretofore described.

15. The violative condition did bear a direct and immediate relationship to employee safety and health.

16. At the time of the current violation, there was a Commission final order against the respondent for a violation of the same standard due to a defective ladder in use in a trench.

17. The evidence establishes that both past and present violations are substantially similar.

18. Respondent was in repeat nonserious violation of 29 CFR 1926.450(a)(2).

19. The appropriate penalty is $125.00.

## §5(a)(1) - Skid Steer Loader Issue

Item 1 of serious citation 1 alleges a violation of §5(a)(1) of the Act as follows:

> Section 5(a)(1) of the Occupational Safety and Health Act of 1970: The employer did not furnish employment and a place of employment which was free from recognized hazards that were causing or likely to cause death or serious physical harm to employees, in that:
>
> > "Bobcat" skid steer loader had no guard to protect operator from scissors points between arms and frame.

§5(a)(1) of the Act provides that:

> Sec. 5.(a) Each employer-
> (1) shall furnish to each of his employees employment and a place of employment which are free from recognized hazards that are causing or are likely to cause death or serious physical harm to his employees;

Most of the surrounding factual circumstances related to this citation are not disputed by the parties. The Melroe Division of the Clark Equipment Company ("Clark" or "Clark's") manufactures a skid-steer loader called a Bobcat 310 ("Bobcat") (Tr. 120-122, 171, Exs. P-12 and P-13). On the date of the inspection, there was a

Bobcat at the worksite in one of the trenches (Tr. 120-121, 169, Ex. P-11). The Bobcat used by respondent at the worksite was the same type as depicted in the specification sheet (sales literature) published by Clark (Tr. 122,171, Ex. P-12).[12] The specification sheet displays a picture of the unit as it is shipped from the factory, together with a schematic drawing with various specifications set forth (Tr. 121-122, Ex. P-12). This Bobcat, a four-wheeled unit with rubber tires, was equipped with a small bucket on the front end (Tr. 120, Exs. P-11, P-12 and P-13). It is steered by braking action applied to the wheels (Tr. 120). The operator of the Bobcat is in a sitting position when using the machine (Tr. 123, 131-132, Ex. P-12, Ex. P-13, page 1). Braking action is caused by the operator pushing and pulling hand levers. The levers are located in front of the operator's seat on both the left and right sides thereof. By manipulation of the levers by hand, the Bobcat moves forward, backward and turns either left or right. While the Bobcat is in motion, an operator must keep his hands on the steering levers to steer it (Tr. 120, 131-132, 159-160, 163, Ex. P-13, page marked 310 BOBCAT LOADER and numbered pages 3 and 4). However, if the Bobcat is not in motion, it is unnecessary for an operator to have his hands on the steering levers when lowering the bucket (Tr. 163). Foot pedals are used to control the hydraulic cylinders to raise and lower the lift arms and attachments thereto such as the bucket. They are also used to tilt attachments (such as the bucket) (Tr. 124-125, 128-130, 132, 159, 163, Ex. P-13, page 5). The hydraulic cylinders are attached by a clevis on both sides of the Bobcat toward the rear of the machine (Tr. 124-125, Ex. P-12, Ex. P-13, pages 1, 22 and second unnumbered page). When

---

[12] Also, see the owner's manual for the same type of Bobcat (Tr. 137, P-13).

the bucket is down at ground level, the hydraulic cylinders are even with the frame of the machine, just above the tires (Tr. 124-125, Ex. P-12, Ex. P-13, cover and inside thereof, pages 1, 2, 8, 22 and second unnumbered page). As the bucket is raised, the hydraulic cylinders move upward which creates a scissor type of pinch point as it leaves the frame of the machine (Tr. 124-126, Ex. P-12, Ex. P-13, page 9). Then, when the bucket is lowered, the scissors narrow and close the pinch points as the hydraulic cylinders meet the frame of the machine (Tr. 125-130, Ex. P-12). The interior space of the Bobcat, where the operator is seated, is approximately 30 inches between the pinch points (Tr. 132-133). The seat is a bucket seat with the edge of the seat higher than the center thereof (Tr. 162). The seating portion of the seat is higher than the frame (Tr. 157-158, 162, Ex. P-12, Ex. P-13, page 2). Measurements were not taken of the difference in height and photographs are of no assistance in making that determination (Tr. 157-158). However, at most, the height differential between the top portion of the bucket seat and the frame is five or six inches (Tr. 161-162).

Since 1972, Clark, the manufacturer, has provided an operator guard on the equipment. It is a cage type of guard which extends up from the frame along both sides of an operator, behind him and over his head (Tr. 123, 136, Ex. P-12, Ex. P-13, pages 22, 29 and second unnumbered page).[13] Although this Bobcat was used when purchased, it had a guard on it such as the one depicted in Ex. P-12. The guard had been removed by respondent's employees (Tr. 135-136, 172). Although Hughes had not ordered the removal of the guard, he was aware that it had been removed and was not being used at the time of the inspection (Tr. 172). CO Cunningham did not see the Bobcat in operation, but observed fresh tracks on

---

13 In effect, the only open space is directly in front of the operator, except for a small opening on the rear side of the guard.

the bottom of the trench leading into the work area, with one set of tracks leading to the parked Bobcat (Tr. 130-131). The Bobcat was being used to remove soil from a tunnel at the worksite; however, the operator's guard on the Bobcat was a fraction of an inch too high to permit the Bobcat to enter the pipe lining the tunnel (Tr. 131, 145-147, 169). As a result, it was removed from the Bobcat (Tr. 127, 135-136, 143, Ex. P-11). Other workers inside the tunnel loaded the bucket by hand while it was at ground level. The operator would then back out of the pipe to a location where a small hopper was located. The bucket was raised three to four feet and the soil was dumped into the hopper. Then, the operator lowered the bucket to ground level and drove the Bobcat back into the tunnel for another load (Tr. 169-171).

If the operator's body or any portion thereof was caught between the pinch points created by the frame and hydraulic cylinders of the Bobcat, it would cause a crushing injury, resulting in broken bones, loss or partial loss of an upper extremity or death (Tr. 141-142, 173). The portion of the body injured would be dependent upon the size of the pinch point (as the bucket is raised, the size of the scissor area increases) and what portion of the operator's body is exposed and caught therein (Tr. 141-142). The cited condition could have been abated by the fabrication of a piece of expanded metal to form an arc over the operator extending from one side of the Bobcat to the other. This would keep the operator in a confined area, preventing him from exposing any body parts to the area of the pinch points (Tr. 142-145, 178-179). It would not be as high or take up as much area as the manufacturer's guard, thereby permitting the Bobcat with the fabricated guard to enter the tunnel (Tr. 143-145, 147-148, 178-179). A sheet of expanded metal can be purchased from a local steel supply house. Any competent welder could form the metal to fabricate such a guard which could be bolted or welded onto the machine (Tr. 143-144, 179). The total cost thereof would be less than $100.00 and the use of such a guard would not result in the loss of production

or efficiency on the job (Tr. 144). In fact, Hughes ordered guards and placed them on the Bobcat so that the operator could not possibly get into the pinch points (Tr. 173, 234).

To establish a violation of Section 5(a)(1) of the Act, the "general duty clause," the Secretary must establish that (i) an employer failed to render its workplace free from a recognized hazard, (ii) the occurrence of an incident was reasonably foreseeable, and (iii) in the event of an incident, the likely consequence was death or serious physical harm to its employees. Bomac Drilling, Division of TRG Drilling Corp., 81 OSAHRC 45/A2, 9 BNA OSHC 1681, 1981 CCH OSHD ¶25,363 (No. 76-450, 1981)("Bomac"). The Secretary must also show that there were feasible means available which the employer could have taken to abate the hazard. Id.; National Realty and Construction Co. v. OSHRC, 489 F.2d 1257 (D.C. Cir. 1973) ("National Realty").

A recognized hazard is a practice or condition in the workplace that is known to be hazardous either by the industry in general or by the employer in particular. Beaird-Poulan, A Division of Emerson Electric Co., 79 OSAHRC 21/D11, 7 BNA OSHC 1225, 1979 CCH OSHD ¶23,493 (No. 12600, 1979) ("Beaird-Poulan"); see Continental Oil Co. v. OSHRC, 630 F.2d 446 (6th Cir., 1980), cert. denied, 101 S.Ct. 1481 (March 2, 1981); Empire Detroit Steel Division, Detroit Steel Corp. v. OSHRC, 579 F.2d 378 (6th Cir., 1978). Moreover, in determining the existence of the recognized hazard, it is the hazard which is relevant, not a specific incident resulting in injury. See Brennan v. OSHRC (Vy Lactos Laboratories, Inc.), 494 F.2d 460 (8th Cir. 1974); Boeing Co., Wichita Division, 77 OSAHRC 188/D13, 5 BNA OSHC 2014, 1977-78 CCH OSHD ¶22,266 (No. 12879, 1977).

In this case, the hazard presented is a crushing injury to an upper extremity of the operator of a Bobcat when the operator cage or guard is not in place, caused by an upper extremity being caught in a scissor type of pinch point formed by the downward motion of hydraulic cylinders to a point where they meet the frame of the machine.[14] Undisputed evidence establishes that (i) it is unnecessary for the operator to have his hands on the steering levers when lowering the bucket if the Bobcat is not in motion, (ii) at most, an operator sits five or six inches above the point where the hydraulic cylinders meet the frame of the machine, and (iii) the interior space where the operator sits is approximately 30 inches between the pinch points. By his own admission, Hughes was concerned about the possible exposure of the operator to a crushing injury between the hydraulic cylinders and the frame of the machine. This is a highly significant admission despite the fact that, after examination of the situation, he concluded that no hazard existed. The Commission has held that matters of common knowledge are a basis for finding a recognized hazard. See Eddy's Bakeries Co., 81 OSAHRC 79/F4, 9 BNA OSHC 2147, 1981 CCH OSHD ¶25,604 (No. 77-1084, 1981); Litton Systems, Inc., Ingalls Shipbuilding Division, 81 OSAHRC , 1982 CCH OSHD ¶25,817 (No. 76-900, 1981). I agree with CO Cunningham that the hazard created by the pinch points is obvious and that

---

14 Due to the work situation in this particular case, a hazard did not exist that the operator's torso would be caught in the pinch points. This results from the bucket being raised only three to four feet from the ground prior to dumping its contents and lowering the bucket (Tr. 169-171). The torso can only be exposed thereto if the bucket is raised to a very high position (Tr. 127, 134, 142).

recognition thereof requires no special training or expertise. The fact that Hughes did not fully appreciate the existence of the hazard does not remove it from the sphere of common knowledge. His reasoning that it would take an intentional act for an incident to occur was based on several faulty premises. They are that (i) when not steering, an operator would always keep arms and hands at his sides, (ii) to suffer a crushing injury, the operator's hand or arm would have to be resting on the frame and thereby be intentional, or (iii) if the upper extremity was struck, it would be at a high enough level (both the extremity and the distance from the frame) to remove it from danger before the hydraulic cylinder met the frame. I agree with CO Cunningham that an operator could through carelessness or inattention easily place any portion of an upper extremity into the path of the hydraulic cylinder or arm as it descends. The Commission has held that momentary lapses of concentration and human error are part of every job. See Georgia Electric Co., 77 OSAHRC 30/A2, 5 BNA OSHC 1112, 1977-78 CCH OSHD ¶21,613 (No. 9339, 1977), aff'd, 595 F.2d 309 (5th Cir. 1979). Human errors in general are foreseeable. It is to prevent such errors that physical means of protection, a guard in this case, are usually preferred. Western Massachusetts Electric Co., 81 OSAHRC 73/B13, 9 BNA OSHC 1940, 1981 CCH OSHD ¶25,470 (No. 76-1174, 1981). Moreover, the extremity could be at an oblique angle where it would not be too distant from the frame, but still be in the path of the arm as it descends.[15] Finally, the contention by Hughes that, if the

---

[15] Here, the hydraulic cylinder would not be high since the bucket was raised only three or four feet from ground level.

hydraulic arm did strike an operator's upper extremity, it could be removed from the scissor area in time simply blinks several important facts. Human beings do not always react in their own best interests in emergency situations. In short, they sometimes panic. Finally, the force of the hydraulic cylinder striking an upper extremity might well throw the operator off balance and further into the area of the scissor type of pinch point. Accordingly, based on the foregoing, I find that (i) the hazard of a crushing injury to an upper extremity of an operator of a Bobcat when the cage or guard is not in place, caused by an upper extremity being caught in a scissor type of pinch point formed by the downward motion of hydraulic cylinders to a point where they meet the frame of the machine, is obvious, (ii) recognition of the hazard can be inferred from the obvious nature of the hazard, and (iii) such an incident is reasonably foreseeable.[16] Uncontraverted testimony establishes that, if such an incident occurred, the likely consequence would be serious physical harm to the operator (Tr. 141-142,

---

16 I have not overlooked the evidence of record related to the manufacturer's warning (owner's manuals and decals in operator cage or guard) not to use a Bobcat without the operator guard. The Commission has held that a warning by a manufacturer about a specifically described hazard is probative evidence of a recognized hazard. Young Sales Corp., 79 OSAHRC 28/A2, 7 BNA OSHC 1297, 1979 CCH OSHD ¶23,768(No. 8184, 1979), aff'd, memo no. 77-1612 (D.C. Cir., 1980). However, the evidence falls short of that in this case. The operator's manual and the decals do not spell out the nature of the hazard of operating the Bobcat without the cage or guard. Here, there are two hazards which the cage or guard protects against, rollover protection and the scissor type of pinch points. However, the above-noted materials do not spell out why use of the cage or guard is required. Moreover, there is no evidence that respondent possessed such a manual or that decals were on this Bobcat. It was not new when purchased by respondent.

173-174). I so find.[17] See Bomac, supra. Hughes was aware of all the facts at the worksite giving rise to the violation. The hazard was obvious. Once again, full appreciation of the hazard by Hughes is not necessary to establish knowledge of its existence. I find the requisite knowledge to be present. His knowledge is imputed to the respondent.

The next issue to be resolved is whether respondent breached its duty to render its worksite free of the recognized hazard. The burden of proof is on the Secretary. National Realty, supra. Here, there is no dispute in the

---

17 In the citation and complaint, the Secretary alleged a serious violation of §5(a)(1). In its brief, respondent argues that there is only a remote possibility that an incident will occur, and therefore, only a remote possibility that serious bodily injury or death would result. §5(a)(1) speaks in terms of ". . . recognized hazards that are causing or are likely to cause death or serious physical harm. . ." §17(k) states, in pertinent part, that a serious violation exists ". . . if there is substantial probability that death or serious physical harm could result. . ." First, I do not understand the Secretary's pleading. I am of the opinion that a §5(a)(1) violation is at least the equivalent of a serious violation by its own terms. In other words, it is not clear to me why a "serious" §5(a)(1) violation would ever be alleged. However, I take respondent's position to run more against foreseeability of an incident. I have already addressed that issue heretofore. The Commission has held that, in a §5(a)(1) allegation, the Secretary has sustained his burden if he establishes that the incident is reasonably foreseeable and the likely consequence in the event of an incident would be death or serious physical harm. It expressly held that the occurrence of an incident need not be likely. See Bomac, supra. In cases alleging a serious violation (§17(k)), the Commission has employed the same rationale. There, the Secretary must establish that, if an accident occurred, there is a substantial probability that death or serious physical harm could result. The probability of an accident occurring is irrelevent. See Niagara Mohawk Power Co., 79 OSAHRC 36/A2, 7 BNA OSHC 1447, 1979 CCH OSHD ¶23,670 (No. 76-2414, 1979). In any event, I find that the Secretary has met his burden under either test.

evidence. The operator's guard had been removed and the Bobcat used in the performance of work thereafter (Tr. 127, 130-131, 135-136, 145-148, 172-174, Ex. P-11). By Hughes' own admission, he was aware of that fact (Tr. 172-174).

It cannot be reasonably questioned that there were feasible means available which the respondent could have taken to abate the hazard (Tr. 142-145). In fact, Hughes agreed that CO Cunningham's method of abatement was feasible (Tr. 178-179). However, he apparently abated the hazard by a different type of guard than the one described by CO Cunningham (Tr. 173, 234).

Under the facts and circumstances of this case, I find that a §5(a)(1) violation of the Act has been established. In light of the record and the statutory penalty criteria set forth in §17(j) of the Act, I conclude that a penalty of $300.00 is reasonable and appropriate.

## FINDINGS OF FACT

The evidence of record having been considered and evaluated in its entirety, the following facts are specifically found:

1. To avoid repetition, those facts set forth (i) under the headings entitled JURISDICITON and PARTIAL RESOLUTION OF THE FACTS, and (ii) those undisputed facts set forth in the third, fourth and fifth paragraphs of the foregoing discussion of item 1 of serious citation 1 (immediately following a recital of §5(a)(1) of the Act), are hereby incorporated by reference to the extent that they are not set forth hereunder.

2. The OSHA inspection in June 1980 disclosed a Bobcat (skid-steer loader) at the worksite in one of the trenches.

3. The Bobcat, a four-wheeled unit with rubber tires, was equipped with a small bucket on the front end.

4. The operator of the Bobcat is in a sitting position when using the machine.

5. The Bobcat is steered by braking action to the wheels. Braking action is caused by the operator pushing and pulling hand levers which are located in front of the operator's seat. By manipulation of the levers, the Bobcat moves forward, backward and turns either left or right. While the Bobcat is in motion, an operator must keep his hands on the steering levers to steer it.

6. If the Bobcat is not in motion, it is unnecessary for an operator to have his hands on the steering levers when lowering the bucket.

7. Foot pedals are used (i) to control the hydraulic cylinders in order to raise and lower the lift arms and attachments thereto such as the bucket, and (ii) to tilt such attachments.

8. The hydraulic cylinders are even with the frame of the Bobcat, just above the tires, when the bucket is at ground level. As the bucket is raised, the hydraulic cylinders move upward which creates a scissor type of pinch point as they leave the frame of the Bobcat. Then, when the bucket is lowered, the scissors narrow and close the pinch points as the hydraulic cylinders meet the frame of the machine.

9. The interior space of the Bobcat, where the operator is seated, is approximately 30 inches between the pinch points. The seating portion of the seat, top portion thereof, is, at most, five or six inches higher than the frame.

10. Since 1972, the manufacturer has provided an operator guard on Bobcats. It is a cage type of guard which extends up from the frame along both sides of the operator, behind him and over his head.

11. The Bobcat was being used at the worksite to remove soil from a tunnel;

however, the operator's guard was a fraction of an inch too high to permit the Bobcat to enter the pipe lining the tunnel. Therefore, the operator's guard had been removed by respondent's employees.

12. Hughes was aware that the operator's guard had been removed from the Bobcat and was not being used at the time of the inspection.

13. Workers inside the tunnel loaded the bucket by hand while it was at ground level. The operator would then back out of the pipe to an area where a small hopper was located. The bucket was raised three to four feet and the soil dumped into the hopper. Then, the operator lowered the bucket to ground level and drove the Bobcat back into the tunnel for another load.

14. The hazard presented is a crushing injury to an upper extremity of the Bobcat operator when the operator guard is not in place, caused by an upper extremity being caught in a scissor type of pinch point formed by the downward motion of the hydraulic cylinders to a point where they meet the frame of the machine.

15. The hazard set forth in finding of fact no. 14 is obvious. Recognition of the hazard can be inferred from the obvious nature thereof.

16. An operator could through carelessness or inattention easily place any portion of an upper extremity into the path of the hydraulic cylinder as it descends, as momentary lapses of concentration and human error are part of every job. Human errors in general are foreseeable.

17. The force of the hydraulic cylinder striking an upper extremity might throw the operator off balance and further into the area of the scissor type of pinch point. Moreover, human beings sometimes panic.

18. The occurrence of such an incident (upper extremity caught in a pinch

point) is reasonably foreseeable.

19. The likely result of such an incident would be serious physical harm to the operator.

20. Hughes was aware of all the facts at the worksite giving rise to the violation. Although he did not fully appreciate the hazard, it was obvious. The requisite knowledge was present. It is imputed to the respondent.

21. The operator's guard had been removed and the Bobcat used in the performance of work thereafter. Therefore, respondent breached its duty to render its worksite free of the recognized hazard.

22. The condition could have been abated by the fabrication of a piece of expanded metal to form an arc over the operator (smaller than the manufacturer's guard) from one side of the Bobcat to another. Consequently, there was a feasible means available which the respondent could have taken to abate the hazard.

23. Respondent was in violation of §5(a)(1) of the Act.

24. The appropriate penalty is $300.00.

## 29 CFR 1926.652(c) - Trench Issue

Item 1 of willful serious citation 2 alleges a violation of 29 CFR 1926.652(c) as follows:

> 29 CFR 1926.652(c): Where the side(s) of the trench(es) above the 5 foot level were sloped to preclude collapse in lieu of shoring, the slope(s) were steeper than 1 foot rise to each 1/2 foot horizontal:
>
> > Employees exposed in trenches (3) on Loop 1 North at Hart Lane. No shoring being used. Sloping was inadequate for soil conditions.

The cited standard provides:

> §1926.652 Specific excavation requirements.
>
> * * *

> (c) Sides of trenches in hard or compact soil, including embankments, shall be shored or otherwise supported when the trench is more than 5 feet in depth and 8 feet or more in length. In lieu of shoring, the sides of the trench above the 5-foot level may be sloped to preclude collapse, but shall not be steeper than a 1-foot rise to each 1/2-foot horizontal. When the outside diameter of a pipe is greater than 6 feet, a bench of a 4-foot minimum shall be provided at the toe of the sloped portion.

Respondent's employees were engaged in work activities related to the installation of a water main beneath Loop 1 North ("the Loop"), pursuant to a contract between respondent and the city of Austin (Tr. 13, 17-18, 167-168). At the worksite, the Loop runs generally north and south with two to three lanes in each direction. It is basically a freeway with heavy traffic (Tr. 17-19, 184, Ex. P-2).[18] Three separate trenches were in existence at the location,

---

18 Ex. P-2 is a diagram prepared by CO Moore, based on visual observations, photographs and measurements of the worksite as it existed on the date of the inspection, June 26, 1980. It represents an overhead view of the worksite (Tr. 19-20). CO Cunningham assisted CO Moore take photographs and measurements (Tr. 15, 26, 117). Measurements were taken with a steel tape, a plumb bob and a long pole (Tr. 26). The photographs were actually taken by CO Moore (Tr. 59-60, Exs. P-9(a)-(k)). A brief description of those pictures found in Ex. 9 is as follows: (a) a view looking down into the trench at the west end of trench B (not at section B-B) (Tr. 60-61); (b) a view looking down into trench B at about the center of the trench (Tr. 62); (c) a view looking toward the east face of trench B, depicting the area represented in section B-B (Tr. 63-65); (d) a different angle of the view in (c) (Tr. 65); (e) a slightly different angle of the views seen in (c) and (d) (Tr. 66); (f) a view of a ladder leaning against a wall, located right at section B-B (Tr. 68); (g) a view of trench A (Tr. 68); (h) a view of the west end of trench C, with the end of the pipe located at section C-C (Tr. 70-71); (i) a slightly different angle of the view in (h) (Tr. 72-73); (g) a closeup view of the soil shown in (i) (Tr. 74); and (k) a view of the east end of trench A, looking almost directly at section A-A (Tr. 74).

running in a generally east-west direction. One trench ("trench A"), west of the southbound lanes of traffic, was rectangular in shape. Another trench ("trench B"), located in the median between northbound and southbound traffic, was shaped like a light bulb. The third trench, ("trench C"), on the east side of the northbound lanes of traffic, was shaped somewhat like a boxing glove (Tr. 21, 168, Ex. P-2).[19] The interior rectangular lines in trenches B and C represent the width of those trenches at the bottom (Tr. 21-22, Ex. P-2).[20] Dotted lines, running across both southbound and northbound lanes of traffic, represent tunnels under those lanes of traffic. However, the tunnel under the southbound lanes had not been completed (Tr. 23-24). Ex. P-2 contains section lines which run from the south to the north wall of the trenches. Those areas are designated as A and A in trench A, B and B in trench B, and C and C in trench C (Tr. 24-25).[21] Exhibit P-3, the other diagram, is a cross-sectional view which shows the dimensions of the three trenches where those section lines (A and A, B and B, and C and C) meet the north and south trench walls (Tr. 26-29, 99-100).[22]

---

19 The different shape of trenches was due to sloping in some areas thereof (Tr. 22).

20 This dimension is not shown for trench A since it was rectangular in shape with very little sloping (Tr. 22).

21 Those lines in trenches B and C run in nearly a straight line from one trench wall to the other. However, that is not true in trench A (Tr. 99, Ex. P-2).

22 Ex. P-3 reflects the dimensions in each of the three trench sections where CO Moore was of the opinion that sloping was inadequate (Tr. 43-44). This exhibit was prepared based on measurements taken at the worksite (Tr. 26). The areas are designated as A-A, B-B and C-C (Ex. P-3). For the most part, the parties and their witnesses referred to sections A-A, B-B and C-C when discussing either Exs. P-2 or P-3. I have distinguished between those two exhibits as follows: trench A contains areas A and A (Ex. P-2) and section A-A (Ex. P-3); trench B contains areas B and B (Ex. P-2) and section B-B (Ex. P-3); and trench C contains areas C and C (Ex. P-2) and section C-C(Ex. P-3).

The trenches were not shored or braced in any manner (Tr. 41, 181). Trench A, rectangular shaped, was approximately 20 feet long. At section A-A, it was 13 feet 10 inches deep, eight feet five inches wide at the top and approximately seven feet one inch wide at the bottom (Tr. 25, 29-30, Exs. P-2 and P-3).[23] There was a 16-inch slope on the left wall of section A-A, but the right side was virtually vertical (Tr. 30, 44, Ex. P-3).[24] Trench B was approximately 35 feet long. Section B-B thereof was 16 feet deep, six feet wide at the bottom and six feet three inches wide (75 inches) at the top (Tr. 25, 30, Exs. P-2 and P-3).[25] The inner left wall of section B-B was sloped at the top. The dimensions of the slope, both vertically and horizontally, were two feet each (Tr. 30-31, Ex. P-3). Since the depth of the trench was 16 feet, the slope began 14 feet above the bottom of the trench (Tr. 31, Ex. P-3). On the right side of section B-B, the trench wall at the top was sloped three feet seven inches (43 inches) horizontally and four feet six inches vertically. Below four feet six inches, the wall was essentially vertical. The depth of the trench was 16 feet. Therefore, the slope began at 11 feet six inches above the bottom of the trench (Tr. 31-32, Ex. P-3). Trench C was approximately 35 feet long. Section C-C thereof was 18 feet six inches deep, six feet wide at the bottom, and seven feet six inches wide at the top (Tr. 25-26, 32-33, Exs. P-2 and P-3).[26] At the bottom of the trench at section C-C was a

---

23 CO Moore's earlier testimony gives somewhat different dimensions on this trench (approximately eight feet wide at the bottom and approximately 12 feet deep) (Tr. 24). However, this was prior to introduction of Ex. P-3. I view the earlier testimony only as approximations and his testimony based on the diagrams as the actual dimensions thereof.

24 This accounts for the differential between the width at the top and the bottom of trench A (Tr. 30).

25 Again, CO Moore's earlier testimony regarding the width at the bottom of the trench appears to have been an approximation (Tr. 25-26).

26 Once again, CO Moore's earlier testimony appears to have been an approximation (Tr. 25-26).

corrugated pipe which had a six-foot diameter. This pipe had been drawn through the tunnel underneath the northbound lanes of traffic (Tr. 33, Ex. P-3). On the right side of section C-C, the trench wall at the top had been sloped from a point one and one half feet (18 inches) horizontally and four feet vertically. At the top of the trench in section C-C was the road surface. This was at the west end of trench C (Tr. 33-34, Ex. P-3).

Originally, Hughes had anticipated only two open trenches on the project, A and C. The intent was to connect those two trenches by the use of a boring machine (Tr. 194). The first step is to run a five-inch drill stem on line and grade through the ground (from A to C underneath all lanes of traffic and the median). Then, a larger drill stem is attached and pulled backward through the hole, cutting or reaming out the desired size of hole. It is not a dry cut as water is flooded into the hole to wash the cuttings back onto the floor of the trench where they can be picked up and removed (Tr. 195). On this project, the boring machine operator had initially used the five-inch drill stem in a west to east direction (trench A to trench C).[27] Then, the large reamer (bigger drill stem) was attached to enlarge the hole back to the boring machine in trench A (east to west). During such an operation, the hole is periodically checked. When the large reamer had reached a point approximately 10 to 15 feet underneath

---

27 Trench B was not in existence at that time. Trench C was opened in approximately March of 1980 (Tr. 214). I assume that trench A was opened at about the same time. Therefore, trenches A and C had been open for approximately three to four months prior to the inspection on June 26, 1980. Trench B had been opened for approximately two and one half months prior to inspection (Tr. 215). Trenches A and B stayed open for approximately five months (Tr. 211). Trench C was open for the approximate period of March-December of 1980 (Tr. 11, 214).

the southbound lanes of traffic, it was discovered that the roof of the tunnel (under the southbound lanes) was caving in and falling down (Tr. 195-196). Emergency barricades were thrown up and the highway engineer ("Gamble") came out to the worksite. Prior to boring, Hughes had drilled test holes, two each on the west side and middle and one on the east side of the road (southbound lanes of traffic), and had the soil tested (Tr. 196-197, 232-233). The problem, a gully, was located between the tests on the west side and middle of the southbound lanes, underneath the highway (Tr. 198). It was subsequently learned that, 30 or 40 years prior to the commercial development of this area, a slurry pit had been dug in that area to receive waste materials (cuttings and water) from a plant at a rock quarry. As a result, there was a gully underneath the middle of the main lane (southbound) (Tr. 197-198). Several days later, Gamble authorized Hughes to drill test holes across the southbound lanes every five feet to ascertain subsurface soil conditions. The material (in the gully) extended from the west side or face of trench B (the east edge of southbound lanes) to within five feet of the east face of trench A (near the west edge of southbound lanes) (Tr. 60-62, 198-199, 203-204, Ex. P-9(a)). This condition was encountered approximately 75 days prior to the inspection. It necessitated a change in the work method. Liner plates were ordered, but were not delivered for almost two months. Thereafter, the pipe was placed into the tunnel as far as it would go. Then, liner plates were bolted together and the soil was removed by hand shovel (Tr. 199-200).[28]

---

[28] In this process, liners are bolted together for protection and then soil is removed. This is performed repetitiously.

Soil samples were taken during the inspection at section B-B from the right wall of trench B by CO Moore, by using a sharp-pointed shovel.[29] They were taken at grade level and one and one half feet, six feet and eight feet below grade level. Soil samples were not taken from sections A-A (trench A) or C-C (trench C). CO Moore maintained custody of the samples until he delivered them to Shilstone Engineering Testing Laboratory ("Shilstone") for a soil analysis (Tr. 32, 36-38, 81-84, 148-149, Ex. P-4). Shilstone's tests included a moisture content determination, Atterberg limits, and a sieve analysis to determine percentages of coarse and fine-grained material.[30] That data enabled Shilstone to classify the soil in accordance with the Unified Classification System.[31] The soil samples were described as follows: ground level - brown, sandy silt; 18 inches - gray clayey, sandy gravel; six feet - dark gray, sandy clay; and eight feet - tan clayey, gravelly sand (Ex. P-4).

---

29 Section B-B is located near the east end or face of trench B (Tr. 63-65, Exs. P-2, P-3, 9(c) and (d)). The area of trench B where the roof of the tunnel caved in or fell was at the opposite end thereof (Tr. 60-62, 203, Ex. P-9(a)).

30 CO Moore requested that Shilstone provide (i) a description and classification of the soil, and (ii) the Atterberg limits of the soil which is indicative of the strength or self-supporting characteristics thereof. He described the Atterberg limit as a combination of the liquid limit and the plasticity index (included in the report). However, he either would not or could not attach any significance to the reported values (Tr. 84-85).

31 Values are set forth in the report for the soil taken at different levels. The stated values are for liquid limit percentage, plasticity index, percentage passing in #200 mesh sieve, classification and description, as well as gradation on several other sieve sizes. The classification is reported in symbols (ML, GC, CL and SP) for the several levels. However, the symbols are not explained in the report (Ex. P-4).

In its brief, respondent correctly states that the crucial issue revolves around the nature of the material in which the trenches were dug. It notes that CO Moore and Cunningham classified the soil as hard and compact while Hughes identified it as rock and cemented gravel. In effect, respondent argues that, based on practical experience, Hughes possesses more expertiese in soil recognition than the compliance officers who were given a short training course in the subject of soils. Respondent points out that CO Moore testified that (i) trench A approached being cemented sand and gravel, (ii) it most closely resembled cemented sand and gravel, and (iii) its soil was not compacted angular gravel. Respondent argues that the report by Shilstone merely contains a description of the soil and does not classify it according to OSHA guidelines. It observes that much of the description identifies the presence of sand and gravel, noting that the description does not identify the soil as hard and compact or eliminate the possibility that the samples were cemented sand and gravel. Respondent directs attention to testimony by Hughes that (i) the material is commonly called caliche which is weathered limestone, (ii) the decaying limestone produces a bond which cements the sand and gravel, (iii) the material (caliche at the trench site) was equivalent to "half-sack" concrete and would never cave in, and (iv) caliche can not be dug with a shovel, but can be dug with a backhoe. Finally, respondent argues that testimony regarding the impact of water in the trenches establishes that the trench sites were composed of cemented sand and gravel.

The Secretary argues that the evidence conclusively establishes that soil conditions fell within the category of hard and compact soils. In support thereof, he argues that (i) the trench was dug in a backfill area, (ii) respondent had difficulty with unstable soil conditions while tunneling under the roadway,

(iii) the compliance officers identified the trench material as a mixture of silt, sand, clay and loam, (iv) their opinions were based on observations, training and opportunity to feel and handle the soil, and (v) their opinions were corroborated by the analysis by Shilstone. He observes that Hughes was unable to identify the category of soil, referring to it at various times as limestone, shale, caliche, cemented sand and gravel and solid rock. He further calls attention to testimony by Hughes that a number of different types of soil material was present in trench walls, including natural earth, a junk layer of compacted material, clay, dirt and stuff hauled in by the highway department. He concludes that, at best, testimony by Hughes establishes the nonhomogenous nature of the soil and that it does not refute the evidence presented by the government.

To resolve the issue presented, it is helpful to summarize certain portions of testimony by the witnesses. A summary thereof follows:

(1) John R. Hughes- Hughes testified that different engineers might call the same soil material severely weathered limestone, cemented sand and gravel, caliche or shale. He observed that these materials actually go on a curve (tendency to be in the same neighborhood of a support system), causing the differing opinions (Tr. 205-206, 222, 224). He stated that caliche in the Austin area is a white layered rock, cemented together like small pieces of limestone laid together with the lime content between the pieces causing them to adhere together. It can be difficult to use a front end loader in one caliche pit, but it can change considerably in 50 feet, e.g., when there is a little clay between the rocks. When referring to caliche in different areas, one can be talking about several different types of soil, some harder than

others (Tr. 208, 223). He would not consider it caliche if it could be dug with a shovel, but caliche (softer) could be dug with a pick and shovel while some caliche (harder) would require the use of a trenching machine. He does not consider caliche to be the same material as shale (Tr. 224). In the Austin area, a reference to caliche is the same as weathered limestone. Cemented sand and gravel has been stuck together by nature with a binder. There is only one area around Austin where it exists, by I-35 and Highway 183 (Tr. 225). It has pea-sized pieces of gravel and it is difficult to drill with a drilling machine (Tr. 225-226). In some locations, there is cemented sand and gravel which approaches man-made cement in terms of consistency and, in others, it is much looser and not compacted or bonded together as well (Tr. 226). When Hughes referred to cemented sand and gravel in the trenches at the worksite, it was man-made by the highway department when establishing the fill. The fill material is wet down and 50,000 pound rollers compact it, smashing limestone and clay, the binding material, together. It was so turned out that it was difficult to tell when you got into it. It approaches the consistency of one-half sack of man-made cement. It was not soil which would cave in (Tr. 226-227). All of the trenches were cut with a Koeh Bantam backhoe 366. It was unnecessary to blast, to use a trench cutter or to use any special equipment (Tr. 227-228). One can use a backhoe to dig a trench in solid rock, except for dolomite and cherts (Tr. 228-229). They encountered no difficulty in digging the trenches, except for one large rock embedded in a shale area in the west end of trench C (apparently on the right wall) (Tr. 209-210, 230-231, Ex. P-9(i)). The trenches did not cave in, except where they were knocked down on purpose (Tr. 201). Hughes agreed that (i) the Loop is heavily traveled, (ii) there is an increased danger of trench collapse

due to vibration from traffic when a trench is located next to a heavily traveled highway such as the Loop. He stated that was the reason barricades were installed and moved over during this problem (Tr. 184). However, he denied that part of the pavement was undercut by a collapse of soil thereunder, stating that traffic had been detoured some 80 feet away and there was no vibration in the area of the trench from traffic (Tr. 184-185). He then stated that barricades were installed and traffic moved to the other side of the road where a problem was encountered on the east side (Tr. 185-186).[32] The barricades were up at least 75 days prior to the inspection (Tr. 186). In response to a question of whether water got into the trenches after they were opened, Hughes testified that he did not remember directly about trench C getting real deep in water, but it was completely full when they went back to tie-in in December and had to be pumped out (Tr. 211-212). He was then asked if he had seen water in there on more than one occasion and responded ". . . probably have and we pumped it out, half a dozen times." He stated that this was during the time that the tunnel was being bored and reamed, explaining that water placed in the tunnel would build up on the top of the head and it would be pumped out (Tr. 195, 212-213).[33] He then stated that it had been full of water two or three times in the two to three month period prior to the inspection (Tr. 213). He further testified that (i) none of the trench walls in A, B or C revealed any cracking or breaking as a result of exposure to water, and (ii) the only sloughing off and caving in occurred under the highway (Tr. 215).[34]

---

32 Based on subsequent testimony by Hughes, it is clear that the above-noted reference to the problem on the east side was a reference to trench C (Tr. 231-232, (Ex. P-9(i)).

33 The reference to top of the head is undoubtedly a reference to the head of the boring machine.

34 A reference to the area of the old slurry pit.

He stated that they were scared of the one in trench C and put the pipe in there to protect workers (Tr. 216). He agreed that trenching is a very hazardous occupation; but, due to his experience, he is capable of recognizing different types of soil and hazardous conditions. He is always looking for signs that a trench might collapse (Tr. 168-169, 179-180, 205). In regard to photographic evidence related to trench C, Hughes agreed that Ex. P-9(h) revealed some undermining of the road surface.[35] However, he stated that this had been done by the backhoe operator. The material on top of the corrugated pipe had not fallen, but was a natural material which had been left there, a hardened material the backhoe could not dig (Tr. 201-202). It was rock, cemented gravel, etc., the same type of material as that on the right hand side of the photograph (Tr. 202-203). He stated that Ex. P-9(i) shows a number of different kinds (about 10) of soil. Starting at the top and working down, he described (i) CO Moore standing on the highway, (ii) approximately ten inches of base material, (iii) one layer looking like caliche and stuff hauled in and compacted by the highway department, (iv) another little line of something else hauled in and compacted by said department, (v) another kind of junk layer of compacted material, a limestone mixed with water when compacted, and (vi) then the natural earth with dirt up on top (apparently on top of the corrugated pipe) (Tr. 209-210). He stated that (i) the big rock had been further to the right, (ii) there was clay on the left wall which had been sloped and (iii) on the right wall, there was caliche, a wetted

---

35 A view of the west end of trench C, with the end of the corrugated pipe located near section C-C (Tr. 70-71). Ex. P-9(i) is a slightly different view of the same area (Tr. 72-73). Ex. P-9(j) is a closeup view of the soil in 9(i)(Tr. 74).

limestone (Tr. 210). With respect to trench B and Ex. P-9(a), he stated that (i) the dark area above the corrugated pipe is the area where the tunnel started caving and falling down, and (ii) the area over the worker's head and coming down at an angle is caliche, shale and conglomerated material (Tr. 203).[36] The material on top (apparently above the corrugated pipe) was fine and sandy, but the bottom two feet was rock, necessitating the use of a jack hammer (Tr. 203-204). He stated that Ex. P-9(c) reveals a color of white above the foreman's head.[37] It is essentially the same material that is on the opposite side of the road. In this area, the Balconies (sic)[38] Fault, soil can change radically within 50 feet. There is a narrow layer of natural dirt above the white layer and directly above that layer is an area where the highway department built a compacted fill when building the Loop (Tr. 206-207). When questioned whether the fill was hauled in by the highway department or basic caliche, he responded that it is a little bit of everything, pointing out grass roots and above that some compacted caliche (Tr. 207-208). He stated that the soil below the dark area was a watered limestone (white area), along with a caliche conglomerate, kind of cemented. His testimony about trench A and Ex. P-9(k) indicates that the trench materials were a conglomerate type, cemented gravels (Tr. 205).[39] He then implicitly agreed that it was compacted angular gravel, together with limestone fragments (Tr. 206).

---

36 A view of the west end of trench B (not at section B-B)(Tr. 60-61).

37 A view looking toward the east face of trench B, depicting the area represented in section B-B (Tr. 63-65).

38 The correct spelling is Balcones.

39 A view of the east end of trench A, looking almost directly at section A-A (Tr. 74).

(2) CO Cunningham - CO Cunningham was of the opinion that the trenches were dug in a hard and compact soil. He stated that there was no possibility whatsoever that it was solid rock, shale or cemented sand and gravel. His opinion was based on observations of the sides of trenches, handling soil and removing soil from a wall of a trench (trench B) with a shovel to obtain soil samples. The soil was granular with some clay in it (Tr. 148-149). He defined granular as gravel pieces or small stones, three to four inches in size and no more than two to three inches in diameter (Tr. 153-154). In one area, he observed some compacted material on top of black loam (Tr. 148-149, 153, Ex. P-9 (e)). He stated that there were some areas where the soil had apparently collapsed. In one area, there was loose material (soil) on a metal pipe, together with some voids between the pipe and the surface above it. On the east side of the worksite, a shoulder of the road was opening up due to supporting material having fallen away (Tr. 149-150). Requested to point out photographic evidence that the soil was not rock, shale or cemented sand and gravel, he stated the following: Ex. P-9 (j), reveals (i) voids where pieces of material have fallen out, and (ii) very small granular pieces, some approximately three to four inches in size and others smaller, which are loose and form the face of the material (Tr.150-151):[40] Ex. P-9(i) shows (i) a void area, previously filled, underneath the road surface where material has fallen away and landed on the pipe in the trench, (ii) some clay type of soil which is sloughing off small stones (left side of photograph), and (iii) various layers which appear to have been in the loam layer (Tr. 151); Ex. P-9(h) depicts

---

40 Ex. P-9(j) is a closeup of the soil shown in Ex. P-9(i). Ex. P-9(h) and (i) are views of the west end of trench C, with the end of the pipe located near section C-C (Tr. 70-74).

basically the same conditions as Ex. P-9(i), as well as loose soil above the corrugated pipe (Tr. 152); Ex. P-9(f) reveals a root growing or coming out of the soil and small pieces of granular material (Tr. 152);[41] and Ex. P-9(e) shows (i) an area of black loam beneath layers of compacted material (left side of photograph approximately one inch below the top of the ladder), and (ii) granular and a stone type of material on the right side of the trench (Tr. 153).[42] The only evidence of previous collapses seen by him was where the six foot corrugated pipe went under the highway. Since his only visit to the jobsite was duing the inspection, he did not know the condition of the trenching operation previous or subsequent thereto (Tr. 160-161).

(3) CO Moore - CO Moore characterized the trench soil as hard and compact. He based this opinion on observations, handling the soil and digging in the soil (Tr. 33-34, 37, 77-78, 80). When asked to set forth the difference between hard and compact soil and solid rock, shale or cemented sand and gravel, he stated that solid rock can only be cut with special equipment, drilled or blasted. He further stated that (i) these trenches were cut with an excavator, (ii) an excavator could not be used to cut through solid rock, shale, or cemented sand and gravel, unless the rock had been broken up or was soft enough to be broken up, and (iii) there was no indication of solid rock or any indication that rock had been broken up (Tr. 35-36). He observed evidence of soil caving in or falling in two locations,

41 Ex. P-9(f) is a view of trench B right at section B-B (Tr. 68).

42 Ex. P-9(e) is a view looking toward the east face of trench B, depicting the area represented in section B-B (Tr. 63-66).

one at the west end of the center trench (trench B) where a substantial quantity of soil had caved in and the other at the west end of the east trench (trench C) (Tr. 36, 105). The only other evidence was the breakdown of soil near the tops of trenches, exhibited by the slope shown in the dimensions on sections A-A through C-C; however, he did not see any soil on the bottom of the trenches and stated that sloping and rounding could have resulted from something done by Hughes, Inc. (Tr. 106). He did not believe the soil was compacted angular gravel (Tr. 97). If there was a 90 degree cut, approximately 12 feet deep, in hard and compact soil which was allowed to fill and sit full of water prior to being pumped out, there would be a substantial weakening of the sides (Tr. 97-98). If that occurred on a repeated basis over a period of time, he would expect to see some cracking, sloughing off and caving in of trench walls (Tr. 98, 101). He would expect to see some damage if this occurred three times in a six-month period. He did not know if this occurred in this case (Tr. 98). In reference to photographic evidence, CO Moore stated that Ex. P-9(a) reveals that a prior cave-in of significance had occurred which casts a shadow above the corrugated pipe (Tr. 61).[43] He testified that Ex. P-9(b) shows loose soil coming out of the corrugated pipe which had been dug from the face (of the tunnel) underneath the highway and pushed back through the pipe (Tr. 63). The soil is similar to the soil above the end of the pipe (Tr. 106-107).[44] He stated that

43 A view of the west end of trench B(not at section B-B)(Tr. 60-61).

44 A view looking down into trench B at about the center of the trench (Tr. 62, 76). The end of the corrugated pipe is at the west end of trench B (Tr. 60-61).

a black line, approximately one and one half inches above the workers head in Ex. P-9(c), was representative of the topsoil in this area, a black clay, prior to any grading operations when the Loop was opened in 1975 (Tr. 64-65, 77).[45] Apparently, a substantial fill, five or six feet in depth, was compacted on top of the original topsoil (Tr. 65). A combination of clay and silt extends from foot level to the dark line. The fill, above the black line, is a mixture of black clay taken from another site. Above that fill, there is the emergence of soil similar to that near the worker's body (Tr. 77-78). The vertical nature of the trench walls at section B-B, indicative of hard and compact soil, can be seen in Exs. P-9(d) and (e) (Tr. 65-66). Tree or bush roots can be seen in the trench wall at section B-B. CO Moore felt the roots were part of the fill when it was placed into position (Tr. 68, Ex. P-9(f)). CO Moore stated that Ex. P-9(g), a photograph of trench A with the bottom thereof at approximately section A-A, reveals a vertical trench wall on the right wall with a slight amount of slope on the left wall (Tr. 68-69, 78-80).[46] The soil in trench A was of a slightly different character than the soil in trenches B and C, with fist to head-sized stones embedded in clay and silt (Tr. 37, 78-80). He stated that the soil in trench A was in the middle classification of hard and compact soil (Tr. 78-80). However, he also stated that (i) it most closely resembled cemented sand and gravel, (ii) it approached being cemented soil, and (iii) it was at a point

46 Also, see his testimony at pages 74 and 75 of the transcript in regard to trench A, together with Ex. P-9(k).

(a step below) where it could become cemented sand and gravel in the future (Tr. 37, 78-80, 102-103). He testified that photographs of trench C reveal (i) loose dirt on the corrugated pipe and a cavity above it indicating a prior cave-in, and (ii) a slight undercutting of the pavement indicating that dirt had fallen (Tr. 70, 72-73).[47] He pointed out that (i) there was a combination of clay and silt at the bottom of the trench which compacts relatively hard, (ii) a black line, above and to the right of the corrugated pipe, represented original topsoil of black clay, and (iii) a layer of fill, mixed material which had been added to complete the road to grade, composed the top five or six feet of the trench walls (Tr. 73-74, 80). CO Moore testified that the trench walls above five feet were sloped adequately in some places and inadequately in other places (Tr. 41). Inadequate sloping was present in those areas designated A and A, B and B, and C and C in Ex. P-2 (Tr. 41-42). The deficiencies in sloping, based on Ex. P-3 and Moore's testimony, were as follows: The right wall of trench A at section A-A, four feet five inches; right wall of trench B at section B-B, one foot eleven inches and left wall, three feet six inches; and the left wall of trench C at section C-C, six feet nine inches and the right wall, five feet three inches (Tr. 43-47).[48]

47 Exs. P-9(h) and (i) are views of the west end of trench C, with the end of the corrugated pipe near section C-C (Tr. 70-71, 72-73). Ex. P-9(j) is a closeup of the soil shown in Ex. P-9(i) (Tr. 74).

48 Moore's testimony regarding deficiencies of sloping of trench walls is based on the difference in footage between (i) dividing two into the remainder of the vertical height of a wall minus five feet, and (ii) the amount of the actual horizontal slope. Where the alleged deficiency was not set forth numerically, I have calculated it based on said formula.

The Secretary establishes a prima facie case of noncompliance with §1926.652(c) by showing that (i) the trench is at least five feet deep and eight feet long, (ii) a significant portion of the trench wall is composed of hard or compact soil, and (iii) the trench is neither shored nor sloped appropriately. This may be rebutted by respondent's establishing that the trench was dug entirely in solid rock, shale, or cemented sand and gravel. CCI, Inc., 80 OSAHRC 127/D4, 9 BNA OSHC 1169, 1981 CCH OSHD ¶25,091 (No. 76-1228, 1980), aff'd, No. 81-1218 (10th Cir. June 9, 1982).[49]

I find that a preponderance of the evidence establishes that Hughes, Inc., failed to comply with the subject standard at its workplace. Respondent argues that the most convincing evidence stems from CO Moore's testimony regarding the expected effect of water on hard and compact soil and testimony by Hughes related to the exposure of trench walls thereto. CO Moore did testify that he would expect to see some damage to trench walls if there was a 90 degree cut, approximately 12 feet deep in hard and compact soil, which was allowed to fill and sit full of water prior to being pumped out as many as three times in a six-month period. However, I do not find testimony by Hughes regarding trench exposure to water to be of a convincing nature. At best, a careful scrutiny

---

49 The Commission also held that (i) trench walls composed of soils with different strengths are only as stable as the weakest component thereof, and (ii) trenches must comply with §1926.652(c) if a significant portion of the trench walls are hard and compact soil. In other cases, it has also held that guidelines for the proper sloping and shoring of trenches of varying dimensions and in varying soil types are contained in Tables P-1 and P-2. Duane Meyer d/b/a/ D.T. Construction Co., 79 OSAHRC 57/D4, 7 BNA OSHC 1560, 1979 CCH OSHD ¶23,742 (No. 16029, 1979); Connecticut Natural Gas Corp., 78 OSAHRC 60/B3, 6 BNA OSHC 1796, 1978 CCH OSHD ¶22,874 (No. 13964, 1978).

thereof reveals it has a tentative quality.[50] At first, he stated that he could not remember trench C's getting real deep in water until going to complete the job (tie in) in December.[51] He then stated that he probably had seen water in there on more than one occasion and it was pumped out a half dozen times. However, it was obvious that Hughes was referring to those occasions when water was intentionally placed into the tunnel during the boring procedure.[52] Thereafter, he stated that, prior to the inspection, he would ". . .say it had been full of water two or three times." Even assuming the accuracy of the last statement, the result does not change. The expected results of nature do not always occur. Moreover, he admitted fear that the walls of trench C would be affected by weather, stating that was the reason the corrugated pipe was installed.[53] This is a highly significant admission. The clear implication is that, prior to the inspection, Hughes felt that the walls of trench C at section C-C posed a hazard to workers. I further find that the evidence establishes that a prior cave-in had occurred at the west face of trench C near section C-C. Hughes denied that a cave-in had

---

50 Insofar as I can ascertain, all of such testimony was directed toward water in trench C. However, it is possible to interpret some of said testimony to apply to the other trenches.

51 This was a number of months after the inspection.

52 He referred to water building up on top of the head. Presumably, this reference is to the head of the boring machine. The height thereof was not stated. However, Ex. P-9(g) appears to illustrate that the height from the trench floor to the head of the boring machine would not be highly significant when compared to height of trench walls. Finally, it does not stand to reason that the water would be allowed to stand for long during this work process.

53 The corrugated pipe was located at the west end of trench C, with the end of the pipe near section C-C (Tr. 70-71, Ex. P-9(h) and (i)).
